JN0-336 Test Centres & Premium JN0-336 Exam

Great concentrative progress has been made by our company, who aims at further cooperation with our candidates in the way of using our JN0-336 exam engine as their study tool. Owing to the devotion of our professional research team and responsible working staff, our JN0-336 training materials have received wide recognition and now, with more people joining in the JN0-336 Exam army, we has become the top-raking training materials provider in the international market. we believe our JN0-336 practice materials can give you a timely and effective helping for you to pass the exam.

Juniper Security, Specialist (JNCIS-SEC) Sample Questions (Q99-Q104):

NEW QUESTION # 99

You want to be alerted if the wrong password is used more than three times on a single device within five minutes. Which Juniper Networks solution will accomplish this task?

- A. Juniper Secure Analytics
- B. Adaptive Threat Profiling
- C. Juniper Identity Management Service
- D. Intrusion Prevention System

Answer: A

Explanation:

The Juniper Networks solution that will accomplish the task of alerting if the wrong password is used more than three times on a single device within five minutes is Juniper Secure Analytics (JSA). JSA is a security intelligence platform that collects, analyzes, and

correlates network data from various sources, such as firewalls, routers, switches, servers, and applications. JSA can detect and respond to threats, anomalies, and vulnerabilities in real time using rules, offenses, reports, and dashboards. JSA can also integrate with JIMS (Juniper Identity Management Service) to obtain user identity information from Active Directory domains or syslog sources. JSA can use this information to create custom rules that trigger offenses or alerts based on user behavior or activity, such as failed login attempts or password changes.

NEW QUESTION # 100

Exhibit

Using the information from the exhibit, which statement is correct?

- A. Node1 is the active node for the control plane
- B. Redundancy group 1 is in an ineligible state.
- C. There are no issues with the cluster.
- D. Redundancy group 0 is in an ineligible state.

Answer: C

NEW QUESTION # 101

Which statement defines the function of an Application Layer Gateway (ALG)?

- A. The ALG uses software processes for permitting or disallowing specific IP address ranges.
- B. The ALG uses software processes for managing specific protocols.
- C. The ALG contains protocols that use one application session for each TCP session.
- D. The ALG uses software that is used by a single TCP session using the same port numbers as the application.

Answer: B

Explanation:

The statement that defines the function of an Application Layer Gateway (ALG) is: The ALG uses software processes for managing specific protocols. An ALG is a security component that operates at the application layer (layer 7) of the OSI model and handles data associated with certain application protocols, such as SIP, FTP, RTSP, etc. An ALG acts as a proxy or intermediary between the client and the server applications and performs various functions, such as address and port translation, resource allocation, application response control, and synchronization of data and control traffic. An ALG can also inspect and modify the application payload to enable firewall or NAT traversal, prevent spoofing or DoS attacks, or enforce granular security policies based on application-specific commands. NEW QUESTION # 102

You are asked to find systems running applications that increase the risks on your network. You must ensure these systems are processed through IPS and Juniper ATP Cloud for malware and virus protection.

Which Juniper Networks solution will accomplish this task?

- A. JIMS
- B. Adaptive Threat Profiling
- C. Encrypted Traffic Insights
- D. UTM

Answer: B

Explanation:

Adaptive Threat Profiling (ATP) is a Juniper Networks solution that enables organizations to detect malicious activity on their networks and process it through IPS and Juniper ATP Cloud for malware and virus protection. ATP is powered by Juniper's advanced Machine Learning and Artificial Intelligence (AI) capabilities, allowing it to detect and block malicious activity in real-time. ATP is integrated with Juniper's Unified Threat Management (UTM) and Encrypted Traffic Insights (ETI) solutions, providing an end-to-end network protection solution.

NEW QUESTION # 103

Which sequence does an SRX Series device use when implementing stateful session security policies using Layer 3 routes?

- A. An SRX Series device will perform a security policy search before conducting a longest-match Layer 3 route table lookup.
- B. An SRX Series device performs a security policy search before implementing an ALG security check on the longest-match Layer 3 route.
- C. An SRX Series device conducts an ALG security check on the longest-match route before performing a security policy search.
- **D. An SRX Series device will conduct a longest-match Layer 3 route table lookup before performing a security policy search.**

Answer: D

Explanation:

The sequence that an SRX Series device uses when implementing stateful session security policies using Layer 3 routes is:

An SRX Series device will conduct a longest-match Layer 3 route table lookup before performing a security policy search: When an SRX Series device receives a packet, it first looks up the destination IP address in the routing table and finds the longest matching route to forward the packet. Then, it performs a security policy search based on the source zone, destination zone, source address, destination address, protocol, and application of the packet. If there is a matching policy that allows the packet, it creates or updates a session entry for the packet and applies any security services configured in the policy.
