Marvelous Books HPE7-A01 PDF – Pass HPE7-A01 First Attempt

Be certain about what you believe and consistent in what you say. If you intend to pass HP HPE7-A01 exam, you must take prompt action. Which is the best for your reference on the website? If you don't know how to choose your reference materials, we commend our Pass4Leader HP HPE7-A01 Study Guide to you. Pass4Leader HP HPE7-A01 certification training materials is the most complete. There is another advantage: we can provide you with free update for a year.

HP Aruba Certified Campus Access Professional Exam Sample Questions (Q49-Q54):

NEW QUESTION # 49

A customer is using Aruba Cloud Guest, but visitors keep complaining that the captive portal page keeps coming up after devices go to sleep.

Which solution should be enabled to deal with this issue?

- A. MAC Caching under the splash page
- B. MAC Caching under the WLAN
- C. Wireless Caching under the splash page
- D. MAC Caching under the user-role

Answer: A

Explanation:

MAC Caching is a feature that allows a guest user to bypass the captive portal page after the first authentication based on their MAC address. MAC Caching can be enabled under the splash page settings in Aruba Cloud Guest. MAC Caching can improve the user experience and reduce the network overhead by eliminating the need for repeated authentication.

NEW QUESTION # 50

You need to ensure that voice traffic sent through an ArubaOS-CX switch arrives with minimal latency. What is the best scheduling technology to use for this task?

- A. DWRR queuing
- B. Strict queuing
- C. QoS shaping
- D. Rate limiting

Answer: B

Explanation:

Strict queuing is the best scheduling technology to use for voice traffic on an AOS-CX switch. Scheduling is a mechanism that determines how packets are transmitted from different queues on an egress port. Strict queuing is a scheduling method that gives the highest priority queue absolute preference over all other queues, regardless of their size or utilization. Voice traffic should be assigned to the highest priority queue and scheduled with strict queuing to ensure minimal latency and jitter. The other options are incorrect because they are either not scheduling methods or not optimal for voice traffic. Reference:

NEW QUESTION # 51

Select the Aruba stacking technology matching each option (Options may be used more than once or not at all.)

Answer:

Explanation:

□ Explanation

- a) Support up to 10 devices per stack -> VSF
- b) Support two devices per stack -> VSX
- c) Individual ISL links up to 400G are supported -> VSX
- d) individual ISL links up to 50G are supported -> VSF
- e) A maximum aggregate ISL bandwidth of 200G is supported -> VSF

NEW QUESTION # 52

A customer is using stacked Aruba CX 6200 and CX 6300 switches for access and a VSX pair of Aruba CX 8325 as a collapsed core 802.1X is implemented for authentication. Due to the lack of cabling, some unmanaged switches are still in use. Sometimes devices behind these switches cause network outages. The switch should send a warning to the helpdesk when the problem occurs. You have been asked to implement an effective solution to the problem. What is the solution for this?

- A. Configure loop protection on all edge ports of the Aruba CX 6200 and CX 6300 switches. No trap option is needed.
- B. Configure spanning tree on the Aruba CX 8325 switches. Set the trap-option.
- **C. Configure loop protection on all edge ports of the Aruba CX 6200 and CX 6300 switches. Set up the trap-option.**
- D. Configure spanning tree on the Aruba CX 6200 and CX 6300 switches. No trap option is needed.

Answer: C

Explanation:

This is the correct solution to the problem of devices behind unmanaged switches causing network outages due to loops. Loop protection is a feature that allows an Aruba CX switch to detect and prevent loops by sending loop protection packets on each port, LAG, or VLAN on which loop protection is enabled. If a loop protection packet is received by the same switch that sent it, it indicates a loop exists and an action is taken based on the configuration. Loop protection should be configured on all edge ports of the Aruba CX 6200 and CX 6300 switches, which are the ports that connect to end devices or unmanaged switches. The trap-option should be set up to send a warning to the helpdesk when a loop is detected. The other options are incorrect because they either do not configure loop protection or do not set up the trap-option. Reference:

NEW QUESTION # 53

You are setting up a customer's 150 headless IoT devices that do not support 802.1X. What should you use?

- A. Multiple Pre-Shared Keys (MPSK) with WPA3-AES
- **B. Multiple Pre-Shared Keys (MPSK) Local**
- C. HPE Aruba Networking ClearPass profiling with WPA-PSK
- D. HPE Aruba Networking ClearPass profiling with MAC-AUTH

Answer: B

NEW QUESTION # 54
