Fortinet FCP - Azure Cloud Security 7.4 Administrator Sample Questions (Q36-Q41):

NEW QUESTION # 36
How are the configurations synchronized between two FortiGate VMs in an active-passive HA with SDN connector failover deployed from the Azure marketplace?

- A. Using system autoscaling during a failover
- B. An Azure function distributes the configuration files
- C. By configuring FGSP on the primary
- D. Using unicast FGCP

Answer: D

Explanation:
In an active-passive HA deployment of FortiGate VMs in Azure using the Marketplace template, configuration synchronization is handled via unicast FortiGate Clustering Protocol (FGCP). FGCP allows the primary unit to replicate its configuration and session

information to the secondary unit, ensuring seamless failover.

NEW QUESTION # 37
Refer to the exhibit.
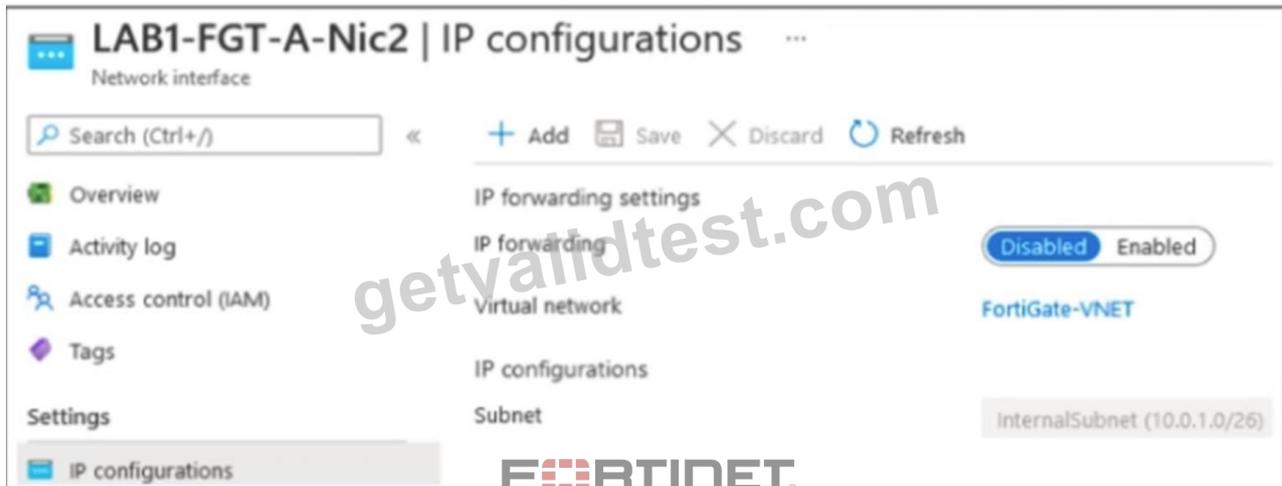

The exhibit shows some of the properties of a virtual NIC that is used by a FortiGate VM deployed in Azure.
The virtual NIC shown is connected to a subnet (10.0.1.0/26) with several VMs that will be accessing the internet through the FortiGate VM.
Which statement is true for this scenario?

- A. The NIC in the exhibit needs to be assigned a public IP address.
- B. You must change the default gateway on the VMs in the Internal Subnet for this to work.
- C. The VMs in the 10.0.1.0/26 subnet can access the internet through FortiGate.
- D. The parameters of the virtual NIC are not configured correctly.

Answer: B

Explanation:
For VMs in the 10.0.1.0/26 subnet to access the internet through the FortiGate VM, their default gateway must be changed to the internal IP address of the FortiGate's NIC in that subnet (e.g., LAB1-FGT-A-Nic2).
This ensures traffic is routed through FortiGate for inspection and NAT, rather than directly using Azure's default system routes.

NEW QUESTION # 38
What characterizes the branch-to-branch topology in an Azure virtual WAN?

- A. Increased redundancy through multiple connections to the central hub
- B. Enhanced security through centralized traffic management
- C. Improved scalability for branch offices connecting to Azure
- D. Simplified network architecture with reduced hub dependencies

Answer: C

Explanation:
The branch-to-branch topology in Azure Virtual WAN is characterized by direct connectivity between branches through the Virtual WAN backbone, which reduces dependency on centralized hubs. This results in a simplified network architecture, lowering latency and optimizing routing between branch locations.

NEW QUESTION # 39
How does Azure ExpressRoute contribute to achieving predictable latency for network traffic?

- A. By prioritizing Azure ExpressRoute traffic over other network traffic
- B. By using public internet connections for enhanced routing flexibility
- C. By establishing dedicated private connections to Azure data centers

- D. By relying on load balancing to dynamically optimize latency

Answer: C

Explanation:
Azure ExpressRouteprovidesdedicated private connectionsbetween on-premises infrastructure and Azure data centers, bypassing the public internet. This results inmore predictable latency, higher reliability, and better security, making it ideal for mission-critical workloads.

NEW QUESTION # 40
What is a requirement when you deploy a FortiGate active-active cluster in Azure?

- A. You must use unicast FGCP to synchronize the configurations.
- B. You must configure both load balancers to allow administrative access.
- C. You must configure all FortiGate VMs with three or more interfaces.
- D. You must assign the public IP address to an Azure load balancer.

Answer: D

Explanation:
In anactive-active FortiGate clusterdeployment in Azure, you must assign thepublic IP address to an Azure load balancer. This is required because Azure does not support multiple VMs sharing a single public IP directly. TheAzure Load Balancerhandles inbound traffic and distributes it to the active FortiGate instances.
