

HP HPE7-A06 Exam Vce & Pass Guaranteed Quiz 2026

HPE Campus Access Switching Expert Written Exam

Realistic Relevant Answers

What's more, part of that ValidExam HPE7-A06 dumps now are free: https://drive.google.com/open?id=1iSBL2GNx-NhT_Heju2eoP5I05tAq6qF6

Our HPE7-A06 exam torrent is available in PDF, software, and online three modes, which allowing you to switch learning materials on paper, on your phone or on your computer, and to study anywhere and anytime with the according version of HPE7-A06 practice test. Before you purchase the system, HPE7-A06 Practice Test provides you with a free trial service, so that customers can fully understand our system before buying; after the online payment is successful, you can receive mail from customer service in 5 to 10 minutes, and then immediately begin to learn HPE7-A06 training prep.

The simulation of the actual HP HPE7-A06 test helps you feel the real HPE7-A06 exam scenario, so you don't face anxiety while giving the final examination. You can even access your last test results, which help to realize your mistakes and try to avoid them while taking the HP HPE7-A06 Certification test.

HPE Campus Access Switching Expert Written Exam latest practice pdf & HPE7-A06 free study torrent

The ValidExam HPE7-A06 exam practice test questions provide a way to assess your understanding of the material, identify areas for improvement, and build confidence and test-taking skills. The ValidExam HPE7-A06 exam practice test questions are real and verified by HPE Campus Access Switching Expert Written Exam (HPE7-A06) exam trainers. They work collectively and strive hard to ensure the top standard of HPE Campus Access Switching Expert Written Exam (HPE7-A06) exam practice questions all the time.

HPE Campus Access Switching Expert Written Exam Sample Questions (Q110-Q115):

NEW QUESTION # 110

A Python developer could not modify the VLAN database on an AOS-CX switch through the REST API. Which settings should the developer check first? (Choose two.)

- A. HTTPS settings
- B. local-user settings
- C. REST API settings
- D. SSH settings
- E. SNMP settings

Answer: A,C

Explanation:

The REST API on AOS-CX switches requires HTTPS to be enabled and properly configured. The developer should also verify that the REST API settings allow modification actions (such as POST/PUT/DELETE) and are not restricted to read-only. SSH and SNMP settings are unrelated, and local-user settings may be relevant for permissions, but the first things to check are HTTPS and REST API configuration.

NEW QUESTION # 111

A user can connect to the wired network using 802.1X EAP-TLS but their traffic is being dropped after a certain time. What is the most likely cause of the traffic being dropped. (Choose two.)

- A. A firewall is blocking traffic between the user's device and the resources they are trying to access.
- B. The user's device is using the wrong MAC address.
- C. The user's device is not assigned to the correct role in HPE Aruba Networking ClearPass Policy Manager.
- D. The user's device is not configured to use the correct gateway.
- E. The user's device is not configured to use the correct DNS servers.

Answer: A,C

Explanation:

After successful 802.1X EAP-TLS authentication, traffic can still be dropped if a firewall is blocking the device's traffic or if ClearPass assigns the wrong role to the device, which enforces restrictive ACLs or VLANs. These are the most likely causes of session drops after authentication.

NEW QUESTION # 112

A user cannot connect to the wired network using 802.1X with EAP-TLS. The user's device is configured correctly and the user has a valid certificate. The RADIUS server logs show that the user is authenticating successfully.

What could be the reason for this issue?

- A. There is an issue with the switch interface configuration.
- B. The user's device is not using the correct certificate authority.
- C. The RADIUS server is not configured to use EAP-TLS.
- D. The switch is not configured to use EAP-TLS.

Answer: A

Explanation:

Since the RADIUS logs show successful authentication with a valid certificate, EAP-TLS is functioning properly between the client and the RADIUS server. If the user still cannot connect, the issue is most likely with the switch interface configuration (e.g., missing VLAN assignment, incorrect role, or port-access settings), which prevents network access after successful authentication.

NEW QUESTION # 113

Match the AOS-CX switch BGP keepalive and holddown timersto the default.

□

Answer:

Explanation:

□

Explanation:

□

The question requires matching the default BGP keepalive and hold-down timers on AOS-CX switches to their respective values.

* Analysis of Options:

* Keepalive Timer: The keepalive timer determines how often BGP keepalive messages are sent to maintain a session. The default value on AOS-CX switches is 60 seconds.

* Hold-down Timer: The hold-down timer specifies the maximum time a BGP session can remain active without receiving a keepalive or update message before it is considered down. The default value on AOS-CX switches is 180 seconds.

* Why This Mapping is Correct: Per BGP standards (RFC 4271) and HPE Aruba Networking AOS-CX documentation, the default BGP keepalive timer is 60 seconds, and the hold-down timer is 180 seconds (three times the keepalive interval). These timers

ensure BGP sessions remain stable while allowing timely detection of peer failures. The AOS-CX implementation adheres to these defaults unless explicitly configured otherwise.

* Relevance to Certification Objectives:

* Routing (16%): Involves designing and troubleshooting BGP routing topologies, including timer configurations.

* Troubleshooting (10%): Includes diagnosing BGP session issues related to timers.

References:

HPE Aruba Networking AOS-CX Configuration Guide: BGP Configuration, detailing default timer values.

HPE7-A06 Study Guide: Covers BGP session management and timers.

RFC 4271: A Border Gateway Protocol 4 (BGP-4), specifying default keepalive and hold-down timers.

NEW QUESTION # 114

A customer has configured eBGP peering using local AS 65000 with two routers from a CX 6300 VSF stack to third-party routers with the following switch ports:

[ports connecting to router - 1 10.10.10.2]

[ports connecting to router - 2 ip 10.10.20.2]

The LAGs are connected to L2 switches, which are used as a transit network for the eBGP routers.

What needs to be enabled on the AOX-CX switch to support bidirectional layer-2 problem detection and faster converge times that the third-party router will support?

- A.
- B.
- C.
- D.

Answer: B,D

Explanation:

UDLD on the LAG interface - UDLD (Unidirectional Link Detection) should be enabled on the LAGs to support bidirectional Layer-2 fault detection, ensuring that one-way failures are caught.

BGP with fall-over bfd under address-family - Configuring BFD (Bidirectional Forwarding Detection) with BGP peers provides sub-second detection of link failures, improving convergence times.

NEW QUESTION # 115

.....

In modern society, we are busy every day. So the individual time is limited. The fact is that if you are determined to learn, nothing can stop you! You are lucky enough to come across our HPE7-A06 exam materials. We can help you improve in the shortest time on the HPE7-A06 exam. Even you do not know anything about the HPE7-A06 Exam. It absolutely has no problem. You just need to accept about twenty to thirty hours' guidance, it is easy for you to take part in the exam. As you can see, our HPE7-A06 practice exam will not occupy too much time.
