Gauge Your Performance and Identify Weaknesses with Online Adobe AD0-E725 Practice Test Engine

Elaborately designed and developed AD0-E725 test guide as well as good learning support services are the key to assisting our customers to realize their dreams. Our AD0-E725 study braindumps have a variety of self-learning and self-assessment functions to detect learners' study outcomes, and the statistical reporting function of our AD0-E725 test guide is designed for students to figure out their weaknesses and tackle the causes, thus seeking out specific methods dealing with them. Our AD0-E725 exam guide have also set a series of explanation about the complicated parts certificated by the syllabus and are based on the actual situation to stimulate exam circumstance in order to provide you a high-quality and high-efficiency user experience. In addition, the AD0-E725 Exam Guide function as a time-counter, and you can set fixed time to fulfill your task, so that promote your efficiency in real test. The key strong-point of our AD0-E725 test guide is that we impart more important knowledge with fewer questions and answers, with those easily understandable AD0-E725 study braindumps, you will find more interests in them and experience an easy learning process.

Adobe Commerce Developer Expert Sample Questions (Q24-Q29):

NEW QUESTION # 24

A Developer is tasked with creating a new index. The custom indexer is not automatically updating the product data. How should the Developer solve this issue?

- A. Use the `mview` to allow tracking database changes.
- B. Use an event observer to monitor data changes.
- C. Implement custom database triggers.

Answer: A

Explanation:

Magento uses the materialized view (`mview`) system to track database changes and trigger automatic updates to indexers. B (`mview`) is correct because it enables Magento to automatically detect data changes and update indexers incrementally. A (observer) is not reliable for large indexing operations and not the recommended method. C (database triggers) are discouraged and not used in Magento's indexing mechanism.

Adobe Commerce DevDocs - Mview and indexing

NEW QUESTION # 25

An Adobe Commerce Developer creates a module that adds a product attribute via a data patch. Adhering to best practices, how should the Developer remove this product attribute when the module is uninstalled?

- A. Delete the custom attribute directly from the database.
- B. Create a new CLI command that needs to be executed before the `bin/magento module:uninstall Vendor_ModuleName`.
- C. Make the patch implement `Magento\Framework\Setup\Patch\PatchRevertableInterface` with the `revert()` method in it.

Answer: C

NEW QUESTION # 26

A Developer connects to the Magento-Cloud CLI and creates a new branch for environment using the following Git command:
`git checkout -b <branch-name>`

The developer notices the branch is not activated and does not automatically build when changes are pushed to the remote

environment.

Which solution will fix this issue?

- A. magento-cloud environment:redeploy --no-wait should be executed after branch creation.
- **B. magento-cloud environment:branch <branch-name> should be used instead of Git commands.**
- C. git branch -b <branch-name> should be used instead of Git checkout.

Answer: B

Explanation:

In Adobe Commerce Cloud, simply creating a Git branch locally does not automatically create a corresponding Cloud environment.

The correct way is to use:

magento-cloud environment:branch <branch-name>

This ensures the environment is created in Cloud, builds automatically, and is linked to the new Git branch.

B redeploys an existing environment but does not create one.

C is just another Git command and does not activate the environment.

Adobe Commerce Cloud DevDocs - Manage environments

NEW QUESTION # 27

A Developer is working on an Adobe Commerce store, and the security team has flagged certain inline scripts in the store as vulnerable to potential attacks. The Developer decides to implement Content Security Policies (CSP) to secure the store's environment.

What will the Developer achieve by taking this action?

- A. Ensure that all user input is sanitized before being processed by the application.
- B. Prevent users from accessing certain areas of the website based on their IP address.
- **C. Restrict which resources (scripts, styles, images) are allowed to load on the website.**

Answer: C

Explanation:

Comprehensive and Detailed Explanation (with official references):

The correct answer is C. Restrict which resources (scripts, styles, images) are allowed to load on the website.

Adobe Commerce supports Content Security Policy (CSP), a browser-level security feature that mitigates certain types of attacks such as Cross-Site Scripting (XSS) and data injection attacks.

By defining a CSP in Adobe Commerce, developers can control:

- * Which scripts can be executed (script-src).
- * Which stylesheets can be applied (style-src).
- * Which images and media can be loaded (img-src, media-src).
- * Whether inline scripts or styles are allowed.

This does not sanitize user input (A) nor restrict user access based on IP addresses (B). Instead, it focuses on restricting the sources of content that the browser can load.

Official Documentation Extracts:

* "Content Security Policy (CSP) is an added layer of security that helps to detect and mitigate certain types of attacks, including Cross-Site Scripting (XSS) and data injection attacks. CSP works by restricting the sources from which content can be loaded."

Adobe Commerce DevDocs: Content Security Policy

* "A CSP allows developers to define approved sources of content that browsers can load. These policies help reduce the risk of malicious content injection in Magento storefronts."- Adobe Commerce Security Guide

NEW QUESTION # 28

A client uses APIs on their Adobe Commerce platform and powers external programs with the data fed from the Adobe API systems. The client reports that it is becoming unmanageable to handle all the API endpoints and would like to have a centralized API system.

Which new feature will help the client with this problem?

- **A. Adobe Commerce API Mesh**
- B. Adobe I/O Events for Adobe Commerce
- C. Adobe Bulk API Handler
