ServiceNow CAD (Certified Application Developer-ServiceNow) certification exam is a valuable credential for professionals who want to demonstrate their expertise in developing applications on the ServiceNow platform. The ServiceNow platform is a cloud-based platform that helps organizations manage digital workflows and automate business processes. The CAD certification exam is designed to test the skills and knowledge of developers who want to build custom applications on the ServiceNow platform.

## ServiceNow Certified Application Developer-ServiceNow Sample Questions (Q65-Q70):

### NEW QUESTION # 65

What is the Endpoint when configuring a REST Message?

- A. The provider response indicates there is no data to send back
- B. The command to the REST script to stop execution

- C. The URI of the Webserver
- **D. The URI of the data to be accessed, queried, or modified**

**Answer: D**

Explanation:

In ServiceNow, when configuring a REST Message, the Endpoint specifies the URI (Uniform Resource Identifier) where the REST request is sent. This URI points to the resource on the external system that the REST message will interact with, whether it's to retrieve, update, create, or delete data.

Key Points:

- \* Endpoint Definition: The Endpoint is a complete URL that includes the protocol (e.g., HTTP or HTTPS), the domain or IP address of the external server, and the specific path to the resource. For example: `https://api.example.com/v1/resources`.
- \* Dynamic Endpoints: ServiceNow allows the use of variables within the Endpoint URL, enabling dynamic substitution at runtime. This is useful when the exact resource path or parameters need to be determined during execution.
- \* Configuration in ServiceNow:
  - \* Navigate to "System Web Services" > "Outbound" > "REST Message."
  - \* Create a new REST Message or select an existing one.
  - \* In the REST Message record, define the Endpoint URL in the "Endpoint" field.

Example Scenario:

If you are integrating ServiceNow with an external ticketing system to retrieve incident data, the Endpoint might be something like `https://api.ticketingsystem.com/incidents/{incident_id}`, where `{incident_id}` is a placeholder that gets replaced with the actual incident ID at runtime.

## NEW QUESTION # 66

What occurs when an existing table is extended in ServiceNow?

- **A. The new table inherits the functionality built into the parent table.**
- B. You must script and configure all required behaviors.
- C. The table's Access Controls are ignored when determining access to the new table's records and fields.
- D. The new table does not inherit any of the fields from the parent table.

**Answer: A**

Explanation:

Table Extension in ServiceNow:

Extending a table in ServiceNow means creating a child table based on a parent table. The child table inherits the fields, configurations, and functionality of the parent table.

What is Inherited:

Fields: All fields from the parent table are available in the child table.

Functionality: The child table benefits from any business logic or workflows defined for the parent table.

Access Controls: The child table respects the Access Control rules defined for the parent table unless explicitly overridden.

Why Other Options Are Incorrect:

Option B: This is incorrect because the new table does inherit fields from the parent table.

Option C: This is incorrect because you do not need to script or configure behaviors from scratch; they are inherited.

Option D: This is incorrect because Access Controls are not ignored; they still apply and can be extended or modified for the child table.

Reference:

ServiceNow Developer Documentation on Table Inheritance.

## NEW QUESTION # 67

Application developers can specify which ServiceNow page a user sees after submitting a new record using the Record Producer UI. How is the page specified?

- A. Write a script in the Record Producer's Script field: `producer.redirect = "<URL>";`
- **B. Create an application property to store the URL**
- C. Write an after Business Rule script for the Record Producer's table: `window.redirect = "<URL>";`
- D. Configure the page in the Module that opens the Record Producer UI

**Answer: B**

Explanation:

Application developers can specify which ServiceNow page a user sees after submitting a new record using the Record Producer UI by writing a script in the Record Producer's Script field: `producer.redirect = "<URL>"`. This script sets the `redirect` property of the producer object to the URL of the desired page. For example, `producer.redirect = "home.do"`; will redirect the user to the homepage after submitting the record. The other options are not valid ways to specify the redirect page for a Record Producer. Reference: Populate record producer data and redirect users

### NEW QUESTION # 68

How would you describe the relationship between the Incident and Task table? I Incident table is extended from Task table

- A. Incident table is related to the Task table via the INC number
- B. Incident table is a database view of the Task table
- C. Incident table has a one to many relationship with the Task table
- D. Incident table has a many to many relationship with the Task table

Answer: C

### NEW QUESTION # 69

Which method call returns true only if the currently logged in user has the `catalog_admin` role and in no other case?

- A. `g_user.hasRoleExactly('catalog_admin')`
- B. `g_user.hasRoleFromList('catalog_admin')`
- C. `g_user.hasRoleOnly('catalog_admin')`
- D. `g_user.hasRole('catalog_admin')`

Answer: A

Explanation:

The method call that returns true only if the currently logged in user has the `catalog_admin` role and in no other case is `g_user.hasRoleExactly('catalog_admin')`. This method checks if the user has exactly one role, and returns true if it matches the argument. The other methods return true if the user has one or more roles, or if the user has any role from a list of arguments.
