## Exam XK0-005 Bible, XK0-005 Best Preparation Materials

An individual can't have a significant understanding of the subject of the CompTIA Linux+ Certification Exam certification in any event, going before scrutinizing accessible. They don't know anything about how to make sense of the center thoughts, which is a test in the event that they need to approach the subtleties to others concerning the CompTIA Linux+ Certification Exam (XK0-005) exam. Thusly, more keen to take help from specialists who have some involvement in the CompTIA Linux+ Certification Exam

(XK0-005) exam. CompTIA XK0-005 Certification Exam concentrate on material which incorporates a rundown of the multitude of points and an outline making sense of the general subject.

## CompTIA Linux+ Certification Exam Sample Questions (Q492-Q497):

### NEW QUESTION # 492

When trying to log in remotely to a server, a user receives the following message:

□ The server administrator is investigating the issue on the server and receives the following outputs:

□ Which of the following is causing the issue?

- A. The wrong permissions are on the user's home directory.
- B. The account was locked out due to three failed logins.
- C. The user has the wrong shell assigned to the account.
- D. The user entered the wrong password.

**Answer: C**

Explanation:

The user has the wrong shell assigned to the account, which is causing the issue. The output 1 shows that the user's shell is set to /bin/false, which is not a valid shell and will prevent the user from logging in. The output 2 shows that the user's home directory has the correct permissions (drwxr-xr-x), and the output 3 shows that the user entered the correct password and was accepted by the SSH daemon, but the session was closed immediately due to the invalid shell.

The other options are incorrect because they are not supported by the outputs.

### NEW QUESTION # 493

An administrator is running a web server in a container named WEB, but none of the error output is showing. Which of the following should the administrator use to generate the errors on the container?

- A. docker logs WEB
- B. docker-compose inspect WEB
- C. docker ps WEB -f
- D. docker run --name WEB --volume /dev/stdout:/var/log/nginx/error.log

**Answer: A**

Explanation:

The docker logs command retrieves logs, including errors, for a running container. By using docker logs WEB, the administrator can check the error output generated by the web server container and debug any issues related to application performance or errors.

### NEW QUESTION # 494

A junior developer is unable to access an application server and receives the following output:

□ The systems administrator investigates the issue and receives the following output:

Which of the following commands will help unlock the account?

- A. pam\_tally2 --user=dev2 --reset
- B. Pam\_tally2 --user=dev2 --quiet
- C. pam\_tally2 --user=dev2
- D. pam\_tally2 --user+dev2 --quiet

**Answer: A**

Explanation:

To unlock an account that has been locked due to login failures, the administrator can use the command pam\_tally2 --user=dev2 --reset (D). This will reset the failure counter for the user "dev2" and allow the user to log in again. The other commands will not unlock the account, but either display or increase the failure count. [CompTIA Linux+ Study Guide], Chapter 4: Managing Users and Groups, Section: Locking Accounts with pam\_tally2  
[How to Lock and Unlock User Account in Linux]

### NEW QUESTION # 495

A security administrator wants to display a warning banner before a user logs in. Which of the following files must be edited to make this happen?

- A. /etc/hosts
- B. /etc/services
- C. /etc/issue
- D. /etc/motd

**Answer: C**

Explanation:

/etc/issue file content is displayed before the login prompt, and/etc/ MOTD content appears after the user successfully logs on to the system.

### NEW QUESTION # 496

A Linux administrator is troubleshooting an issue in which an application service failed to start on a Linux server. The administrator runs a few commands and gets the following outputs:

Based on the above outputs, which of the following is the MOST likely action the administrator should take to resolve this issue?

- A. Enable the logsearch.service and restart the service.
- B. Update the KillSignal configuration for the logsearch.service to use TERM.
- C. Increase the TimeoutStartUsec configuration for the logsearch.service.
- D. Update the OnCalendar configuration to schedule the start of the logsearch.service.

**Answer: C**

Explanation:

Explanation

The administrator should increase the TimeoutStartUsec configuration for the logsearch.service to resolve the issue. The output of `systemctl status logsearch.service` shows that the service failed to start due to a timeout.

The output of `cat /etc/systemd/system/logsearch.service` shows that the service has a TimeoutStartUsec configuration of 10 seconds, which might be too short for the service to start. The administrator should increase this value to a higher number, such as 30 seconds or 1 minute, and then restart the service. The other options are incorrect because they are not related to the issue. The service is already enabled, as shown by the output of `systemctl is-enabled logsearch.service`. The service does not use an OnCalendar configuration, as it is not a timer unit. The service does not use a KillSignal configuration, as it is not being killed by a signal.
