Now let me introduce the PDF version of our 1Z0-1072-25 exam questions to you. It is very easy for you to download the PDF version of our 1Z0-1072-25 study materials, and it has two ways to use. On the one hand, you can browse and learn our 1Z0-1072-25 learning guide directly on the Internet. On the other hand, you can print it on paper so you can take notes. As it takes no place so that you can bring with you wherever you go.

Oracle 1Z0-1072-25 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"> • Compute: This section measures skills of cloud architects responsible for designing scalable and resilient infrastructure, covering compute instance configuration, autoscaling policies, and OS management. It evaluates understanding of OCI compute image options, infrastructure maintenance processes, and strategies for optimizing instance performance across availability domains.
Topic 2	<ul style="list-style-type: none"> • Storage: Designed for storage administrators managing enterprise data solutions, this section tests proficiency in deploying Block • File • Object Storage with lifecycle management, cross-region replication, and tiered storage strategies. It includes configuring volume groups, snapshots, versioning, and security controls while analyzing storage performance metrics and cost optimization techniques.
Topic 3	<ul style="list-style-type: none"> • Networking: Targeting network architects designing secure cloud architectures, this domain focuses on Virtual Cloud Network (VCN) implementation, including subnet design, IP address management, and routing through gateways (NAT, service, internet). It assesses expertise in VPN • FastConnect deployment, DNS configuration, load balancer setup, and advanced tools like Network Path Analyzer for troubleshooting latency or connectivity issues.
Topic 4	<ul style="list-style-type: none"> • Identity and Access Management (IAM): This domain validates skills of security architects implementing granular access controls, emphasizing IAM policy creation, compartment organization, and dynamic group configuration. It covers identity domain management, network source restrictions, and tag-based access mechanisms to enforce least-privilege principles across OCI resources

Hot Reliable 1Z0-1072-25 Exam Pdf | Efficient New 1Z0-1072-25 Test Review: Oracle Cloud Infrastructure 2025 Architect Associate 100% Pass

What is your dream? Don't you want to make a career? The answer must be ok. Then, you need to upgrade and develop yourself. You worked in the IT industry, through what methods can you realize your dream? Taking IT certification exam and getting the certificate are the way to upgrade yourself. At present, Oracle 1Z0-1072-25 Exam is very popular. Do you want to get Oracle 1Z0-1072-25 certificate? If it is ok, don't hesitate to sign up for the exam. And don't worry about how to pass the test, Exam4Docs certification training will be with you.

Oracle Cloud Infrastructure 2025 Architect Associate Sample Questions (Q22-Q27):

NEW QUESTION # 22

A financial firm is designing an application architecture for its online trading platform that should have high availability and fault tolerance. What should the architect do to avoid any costly service disruptions and ensure data durability?

- A. Create a lifecycle policy to regularly send data from the Standard to Archive storage.
- B. Create a new Object Storage bucket in another region and configure recycle policy to move data every 5 days.
- C. Copy the Object Storage bucket to a block volume.
- D. Create a replication policy to send data to a different bucket in another OCI region.

Answer: D

Explanation:

For an online trading platform requiring high availability and fault tolerance, it's critical to ensure data durability and avoid any costly service disruptions. In Oracle Cloud Infrastructure (OCI), Object Storage is often used to store critical data, such as transaction logs or user data, due to its scalability, durability, and reliability.

Option B is the most suitable approach for ensuring data durability and availability across regions. Here's why:

Cross-Region Replication (CRR): OCI offers a feature called Cross-Region Replication for Object Storage. This feature allows you to automatically and asynchronously replicate objects in a bucket from one OCI region to another. This setup ensures that even if one region experiences a failure, the data is still available in another region, thereby meeting the requirements for high availability and fault tolerance.

Data Durability: By replicating data to another region, you protect against regional outages. OCI guarantees 99.995% availability for replicated data, which is critical for a financial firm's trading platform where data consistency and durability are paramount.

Disaster Recovery: With data replicated in another region, the trading platform can quickly switch to using the data in the secondary region in case of a disaster in the primary region. This setup significantly reduces recovery time objectives (RTO) and ensures business continuity.

Option A: Creating a new Object Storage bucket in another region and configuring a recycle policy to move data every 5 days does not provide real-time data availability or the fault tolerance required for a financial application. Recycle policies are intended for managing the lifecycle of data, not for high availability or disaster recovery.

Option C: While lifecycle policies are useful for moving less frequently accessed data to a more cost-effective storage tier (e.g., from Standard to Archive), they do not address cross-region redundancy or real-time availability, which are critical for this use case.

Option D: Copying an Object Storage bucket to a block volume is not a recommended practice for ensuring data durability and fault tolerance. Block volumes are used for persistent storage attached to compute instances, and copying object storage data to block volumes does not achieve the same level of redundancy and cross-region availability as replication policies.

Thus, Option B is the correct and most efficient method for ensuring high availability and fault tolerance in this scenario.

NEW QUESTION # 23

Which Traffic Management Steering Policy facilitates the distribution of DNS traffic based on the geographical location of end users?

- A. Proximity Steering

- B. IP Prefix Steering
- C. ASN Steering
- **D. Geolocation Steering**

Answer: D

Explanation:

Geolocation Steering in OCI's Traffic Management Steering Policy allows you to distribute DNS traffic based on the geographical location of the end users. This method helps direct users to the nearest regional endpoint, optimizing latency and improving user experience.

Use Cases: Geolocation Steering is commonly used to deliver region-specific content, comply with data residency laws, or optimize service performance by directing traffic to the closest available servers.

NEW QUESTION # 24

Which is NOT a necessary step to complete this setup for instance principals?

- A. Create a policy granting permissions to the dynamic group to access services in your compartment or tenancy.
- **B. Generate Auth Tokens to enable instances in the dynamic group to authenticate with APIs.**
- C. Create a dynamic group with matching rules to specify which instances can make API calls against services.
- D. Deploy the application and the SDK to all the instances that belong to the dynamic group.

Answer: B

Explanation:

Instance principals in OCI allow compute instances to directly make API calls against OCI services without requiring a user account.

To set up instance principals, the following steps are necessary:

A . Deploy the application and SDK: The application running on the instances must use the OCI SDK or CLI to make API calls.

B . Create a dynamic group: Define a dynamic group with matching rules to identify which instances can use the API permissions.

C . Create a policy: Write an IAM policy that grants the dynamic group the necessary permissions to access services.

Option D is NOT necessary because instances in a dynamic group use instance principals to authenticate and do not require Auth Tokens, which are used for user authentication with APIs.

NEW QUESTION # 25

How would you allow access to FSS for a DB System with read-only permissions?

- **A. Create an NFS export option that allows READ_ONLY access.**
- B. Modify the security list to allow stateful ingress rules.
- C. Create an instance principal for the DB System.
- D. Modify the security list to allow stateless ingress rules.

Answer: A

Explanation:

To allow access to Oracle Cloud Infrastructure (OCI) File Storage Service (FSS) for a Database (DB) System with read-only permissions, you should create an NFS export option that specifies READ_ONLY access.

NFS Export Options: These options define the access permissions (read/write or read-only) for clients connecting to the file system. By setting the export option to READ_ONLY, you ensure that the DB System can only read from the FSS and cannot modify or delete files.

NEW QUESTION # 26

Which compute capacity type would you select to meet these requirements?

- A. Preemptible capacity
- **B. On-demand capacity**
- C. Dedicated host
- D. Capacity reservation

Answer: B

Explanation:

On-demand capacity is the compute capacity type in Oracle Cloud Infrastructure (OCI) that allows you to provision and use compute instances whenever needed, without any long-term commitment. This flexibility is ideal for various workloads, including development, testing, and production environments, where immediate availability and scalability are crucial.

Key Points:

On-Demand Capacity: On-demand compute instances provide users with the flexibility to spin up instances as required and only pay for the time the instances are running. This model is most suitable for workloads with unpredictable usage patterns or short-term requirements.

Flexibility and Scalability: With on-demand capacity, you can quickly scale your resources up or down based on your application's needs, ensuring that you only pay for the resources you actually use.

No Commitment: Unlike reserved capacity, on-demand capacity does not require any long-term commitment or upfront payment, making it an attractive option for organizations looking to avoid capital expenditures.

Reference:

Explanation of Incorrect Options:

A . Capacity reservation: This option allows you to reserve capacity in advance, ensuring that resources are available when needed. It's ideal for predictable workloads but may not be as cost-effective for fluctuating demands.

B . Preemptible capacity: Preemptible instances are a lower-cost option where instances can be terminated by OCI if resources are needed elsewhere. This is suitable for non-critical workloads that can tolerate interruptions.

D . Dedicated host: Dedicated hosts provide physical servers for your exclusive use, offering isolation and predictable performance. This option is more suitable for workloads requiring dedicated resources or compliance needs.

Thus, Option C: On-demand capacity is the correct choice for most general-purpose workloads needing flexibility and immediate availability without long-term commitment.
