CS0-003 Exam Exercise - Valid CS0-003 Exam Tips

As is known to us, getting the newest information is very important for all people to pass the exam and get the certification in the shortest time. In order to help all customers gain the newest information about the CS0-003 exam, the experts and professors from our company designed the best CS0-003 Study Materials. The IT experts will update the system every day. If there is new information about the exam, you will receive an email about the newest information about the CS0-003 study materials.

CompTIA Cybersecurity Analyst (CySA+) Certification Exam Sample Questions (Q116-Q121):

NEW QUESTION # 116

Which of the following is the best use of automation in cybersecurity?

- A. Reduce the time for internal user access requests.
- B. Eliminate configuration errors when implementing new hardware.
- C. Ensure faster incident detection, analysis, and response.

- D. Lower costs by reducing the number of necessary staff.

Answer: C

Explanation:

Automation in cybersecurity is best utilized to improve the speed and accuracy of incident detection, analysis, and response. Tools like SOAR (Security Orchestration, Automation, and Response) streamline workflows, allowing analysts to focus on more complex tasks while reducing response times. This ensures quicker containment and mitigation of threats.

NEW QUESTION # 117

A security analyst identifies a device on which different malware was detected multiple times, even after the systems were scanned and cleaned several times. Which of the following actions would be most effective to ensure the device does not have residual malware?

- A. Upgrade the device to the latest OS version.
- **B. Replace the hard drive and reimage the device.**
- C. Update the device and scan offline in safe mode.
- D. Download a secondary scanner and rescan the device.

Answer: B

Explanation:

* Reimaging the device is the most effective way to eliminate persistent malware because some sophisticated malware, such as rootkits and firmware-level threats, can survive traditional scans and removals.

* If a system keeps getting reinfected after cleaning, it may indicate a deeply embedded persistent threat, possibly in:

* The Master Boot Record (MBR) or EFI firmware.

* A compromised system restore point.

* A hidden backdoor left by the malware.

Why Not Other Options?

* A (Update and scan in safe mode) # Might help, but if malware is persistent, it will likely return.

* C (Upgrade OS) # Does not necessarily remove malware; some malware survives OS upgrades.

* D (Secondary scanner) # Useful for detection but does not guarantee complete removal.

Best Practice:

* Replace the hard drive to eliminate firmware-level infections.

* Reimage the system from a known-good source.

* Update the OS and security patches before reconnecting to the network.

NEW QUESTION # 118

An organization has tracked several incidents that are listed in the following table:

Which of the following is the organization's MTBD?

Start time	Detection time	Time elapsed in minutes
7:20 a.m.	10:30 a.m.	180
12:00 a.m.	2:30 a.m.	150
9:25 a.m.	12:15 p.m.	170
3:25 p.m.	5:45 p.m.	140

- A. 0
- **B. 1**
- C. 2
- D. 3

Answer: B

Explanation:

The MTTD (Mean Time To Detect) is calculated by averaging the time elapsed in detecting incidents. From the given data: $(180+150+170+140)/4 = 160$ minutes. This is the correct answer according to the CompTIA CySA+ CS0-003 Certification Study Guide1, Chapter 4, page 161. References: CompTIA CySA+ Study Guide: Exam CS0-003, 3rd Edition, Chapter 4, page 153; CompTIA CySA+ CS0-003 Certification Study Guide, Chapter 4, page 161.

NEW QUESTION # 119

Which of the following threat actors is most likely to target a company due to its questionable environmental policies?

- A. Lone wolf
- B. Organized crime
- C. Hactivist
- D. Nation-state

Answer: C

Explanation:

Hactivists are threat actors who use cyberattacks to promote a social or political cause, such as environmentalism, human rights, or democracy. They may target companies that they perceive as violating their values or harming the public interest. Hactivists often use techniques such as defacing websites, launching denial-of-service attacks, or leaking sensitive data to expose or embarrass their targets.

NEW QUESTION # 120

During an incident involving phishing, a security analyst needs to find the source of the malicious email.

Which of the following techniques would provide the analyst with this information?

- A. Packet capture
- B. Header analysis
- C. SSL inspection
- D. Reverse engineering

Answer: B

Explanation:

Header analysis is the technique of examining the metadata of an email, such as the sender, recipient, date, subject, and routing information. It can help to identify the source of a malicious email by revealing the IP address and domain name of the originator, as well as any spoofing or redirection attempts. References:
