

Analytics-Admn-201 Valid Exam Tips - Latest Analytics-Admn-201 Real Test

2026 Latest RealValidExam Analytics-Admn-201 PDF Dumps and Analytics-Admn-201 Exam Engine Free Share:
<https://drive.google.com/open?id=1ohPAuM8CFua0YfBcPqt-AZ-0jwC6qY75>

Our Analytics-Admn-201 exam Braindumps are available in PDF, software, and online three modes, which allowing you to switch learning materials on paper, on your phone or on your computer, and to study anywhere and anytime. And in any version of Analytics-Admn-201 practice materials, the number of downloads and the number of people used at the same time are not limited. You can practice repeatedly for the same set of Analytics-Admn-201 Questions and continue to consolidate important knowledge points.

Salesforce Analytics-Admn-201 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Installation and Configuration: This section of the exam measures the skills of Server Engineers and covers the process of installing Tableau Server, understanding installation paths, identity store options, SSO integrations, SSL setup, and silent installs. Candidates also need to demonstrate the ability to configure Tableau Server by setting cache, distributing processes, customizing sites, and configuring user quotas. It further includes adding users, managing their roles and permissions, and applying Tableau's security model at different levels from sites to workbooks.
Topic 2	<ul style="list-style-type: none">Administration: This section of the exam measures the skills of Tableau Administrators and covers the day-to-day tasks of maintaining Tableau Server. Candidates should understand how to create and manage schedules, subscriptions, backups, and restores, as well as how to use tools such as TSM, Tabcmd, and REST API. It emphasizes monitoring, server analysis, log file usage, and embedding practices. It also includes managing projects, sites, and nested structures, while contrasting end-user and administrator abilities. Knowledge of publishing, web authoring, sharing views, caching, and data source certification is also tested.

Topic 3	<ul style="list-style-type: none"> • Troubleshooting: This section of the exam measures the skills of Support Specialists and covers resolving common Tableau Server issues. Candidates must know how to reset accounts, package logs, validate site resources, rebuild search indexes, and use analysis reports. It also includes understanding the role of browser cookies and creating support requests when needed.
Topic 4	<ul style="list-style-type: none"> • Connecting to and Preparing Data: This section of the exam measures the skills of Tableau Administrators and covers the basic understanding of Tableau Server's interface, navigation, and overall topology. Candidates are expected to recognize both client and server components, understand how these interact, and know where to find information about versions, releases, and updates. It also focuses on system requirements, including hardware, operating systems, browsers, email configurations, cloud considerations, and licensing models. Additionally, it examines knowledge of server processes, data source types, network infrastructure, and ports needed for a stable deployment.
Topic 5	<ul style="list-style-type: none"> • Migration & Upgrade: This section of the exam measures the skills of System Engineers and covers the process of upgrading and migrating Tableau Server environments. Candidates should understand how to carry out clean reinstalls, migrate servers to new hardware, and maintain backward compatibility during the process.

Latest Salesforce Analytics-Admn-201 Real Test - Reliable Analytics-Admn-201 Test Tutorial

Under coordinated synergy of all staff, our Analytics-Admn-201 guide materials achieved to a higher level of perfection by keeping close attention with the trend of dynamic market. They eliminated stereotypical content from our Analytics-Admn-201 practice materials. And if you download our Analytics-Admn-201 study quiz this time, we will send free updates for you one year long since we promise that our customers can enjoy free updates for one year.

Salesforce Certified Tableau Server Administrator Sample Questions (Q18-Q23):

NEW QUESTION # 18

Which two tasks always require a server administrator? (Choose two.)

- A. Creating a schedule
- B. Adding a site
- C. Adding users
- D. Locking project permissions

Answer: B,C

Explanation:

In Tableau Server, roles and permissions dictate who can perform specific administrative tasks. A "server administrator" has full control over the entire Tableau Server deployment, while site administrators manage specific sites. Some tasks are restricted to server administrators due to their server-wide impact.

Option B (Adding a site): Creating a new site in a multi-site Tableau Server environment is a server-level task that only a server administrator can perform. Sites are logical partitions within the server, and adding a site affects the overall server structure. Site administrators cannot create new sites; they can only manage existing ones.

Option D (Adding users): Adding users to Tableau Server (e.g., via the TSM interface or tabcmd) is a server administrator task when it involves adding users at the server level or assigning them to the default site. While site administrators can add users to their specific site in a multi-site environment, the initial addition of users to the server requires server administrator privileges. The question's phrasing ("always require") suggests a server-wide context, making this a correct choice.

Option A (Creating a schedule): This is incorrect because both server administrators and site administrators can create schedules for tasks like extract refreshes or subscriptions within their scope. It's not exclusive to server administrators.

Option C (Locking project permissions): This is incorrect because locking project permissions can be done by a site administrator or project leader with appropriate permissions. It's a project-level action, not a server-level task requiring a server administrator.

Reference: Tableau Server Documentation - "Administrative Tasks" (<https://help.tableau.com/current/server>)

/en-us/admin_tasks.htm) and "User Management" (<https://help.tableau.com/current/server/en-us/users.htm>).

NEW QUESTION # 19

You are the server administrator of a single-node Tableau Server installation. The server hosts five schedules that each execute once a day: Weekday 3:00 PM Extract Refresh, Weekday 5:00 PM Subscription, Weekday 2:00 AM Extract Refresh, Weekday 7:00 AM Extract Refresh, and Weekday 8:00 AM Subscription. The schedules are scheduled to execute during periods when Tableau Server is least active. The busiest period for your server is immediately after the workday begins at 9:00 AM. The office of the CEO reports that every morning at 9:00 AM, they access the views in a particular workbook. The data for these views is refreshed by a task associated with the 7:00 AM schedule. The CEO reports that the data in the views is only being refreshed about 70% of the time. What should you do to attempt to resolve the CEO's problem?

- A. Set the priority of this task to 100
- B. Set the default priority of this schedule to 50
- **C. Set the priority of this task to 1**
- D. Set the priority for all other tasks to 50

Answer: C

Explanation:

In Tableau Server, schedules manage tasks like extract refreshes and subscriptions. Each task within a schedule has a priority value (ranging from 1 to 100, where 1 is the highest priority and 100 is the lowest).

Tasks with higher priority (lower numbers) are executed before tasks with lower priority (higher numbers) when queued by the Backgrounder process. If the Backgrounder is overloaded or delayed, lower-priority tasks may not complete on time, leading to inconsistent refreshes.

In this scenario:

The 7:00 AM Extract Refresh task is critical for the CEO's workbook, but the data is only refreshed 70% of the time by 9:00 AM. The server has a single node, meaning a single Backgrounder process handles all tasks. With five schedules (some overlapping in the early morning), contention or delays could prevent the 7:00 AM task from completing reliably before 9:00 AM.

Option C (Set the priority of this task to 1): Correct. Setting the task priority to 1 ensures it has the highest priority among all queued tasks. This increases the likelihood that the Backgrounder executes it promptly at 7:

00 AM, completing the refresh before the CEO accesses the workbook at 9:00 AM. You can adjust task priority in the Tableau Server web interface under Schedules > Tasks > Edit Priority.

Option A (Set the default priority of this schedule to 50): Incorrect. The default priority for schedules is already 50, and this option refers to the schedule's default, not the specific task. It wouldn't address the contention issue.

Option B (Set the priority for all other tasks to 50): Incorrect. This keeps all tasks at the default priority (50), leaving the 7:00 AM task without a relative advantage. It doesn't prioritize the CEO's task.

Option D (Set the priority of this task to 100): Incorrect. Priority 100 is the lowest, which would deprioritize the task, making the refresh even less reliable.

Reference: Tableau Server Documentation - "Manage Schedules and Tasks" (https://help.tableau.com/current/server/en-us/schedule_manage.htm).

NEW QUESTION # 20

What event is most likely to cause problems for a Tableau Server?

- A. Separating the Backgrounder and VizQL processes to different machines
- B. Using a non-default installation path
- C. Configuring the server to use a static IP address
- **D. Running additional software on the server**

Answer: D

Explanation:

Tableau Server's performance and stability depend on dedicated resources and proper configuration. Running additional software on the same server is the most likely to cause problems because:

* Resource contention: Tableau Server requires significant CPU, RAM, and disk I/O. Other software (e.g., databases, web servers) can compete for these resources, leading to slowdowns, crashes, or failed tasks.

* Port conflicts: Tableau uses specific ports (e.g., 80, 443, 8850), and other applications might interfere.

* Security risks: Additional software increases the attack surface, potentially compromising Tableau Server.

Tableau recommends running the server on dedicated hardware without unrelated applications.

* Option A (Running additional software on the server): Correct. This is a common cause of performance issues and is explicitly discouraged in Tableau's best practices.

* Option B (Separating the Backgrounder and VizQL processes to different machines): Incorrect. This is a supported multi-node configuration that can improve performance, not cause problems, if properly set up via TSM.

* Option C (Configuring the server to use a static IP address): Incorrect. A static IP is recommended for Tableau Server to ensure consistent network access, so it's unlikely to cause issues.

* Option D (Using a non-default installation path): Incorrect. While not default, a custom path is supported (via TSM or installer options) and unlikely to cause problems if permissions and disk space are adequate.

Reference: Tableau Server Documentation - "Best Practices for Installation" (https://help.tableau.com/current/server/en-us/install_best_practices.htm).

NEW QUESTION # 21

What account should you use to run the Tableau Server installation program?

- A. An account in the local administrator group
- B. A local user account
- C. A domain user account
- D. An NT AUTHORITY\NetworkService account

Answer: A

Explanation:

Installing Tableau Server on Windows requires an account with sufficient privileges to configure services, write to the file system, and manage registry settings. Let's analyze this in depth:

* Installation Requirements:

* The installer creates services (e.g., Tableau Server Gateway), writes to Program Files and ProgramData, and configures TSM.

* It needs local administrative privileges on the machine to perform these tasks.

* Post-install, a "Run As" account can be set for services (e.g., NT AUTHORITY\NetworkService), but this is separate from the install account.

* Option C (An account in the local administrator group): Correct.

* Why: The account must be in the local Administrators group to:

* Install software (UAC elevation).

* Configure services and ports.

* Write to protected directories (e.g., C:\Program Files\Tableau).

* Examples: A local admin (e.g., Administrator) or a domain user added to the Administrators group (e.g., DOMAIN\AdminUser).

* Process: Log in as this account, run the installer, and provide TSM admin credentials during setup.

* Option A (A local user account): Incorrect.

* A standard local user (not in Administrators) lacks permissions-installation would fail with "Access Denied" errors.

* Option B (A domain user account): Incorrect unless clarified.

* A domain user without local admin rights can't install. If it's in the Administrators group, it qualifies, but C is more specific.

* Option D (NT AUTHORITY\NetworkService): Incorrect.

* This is a built-in service account for running services (default "Run As" post-install), not for executing the installer-an interactive user account is required.

Why This Matters: Using the right account prevents install failures and ensures secure configuration- critical for production setups.

Reference: Tableau Server Documentation - "Install and Configure Tableau Server" (https://help.tableau.com/current/server/en-us/install_config.htm).

NEW QUESTION # 22

Which three items can be contained in a project? (Choose three.)

- A. Nested Projects
- B. Workbooks
- C. Groups
- D. Data Sources

Answer: A,B,D

Explanation:

In Tableau Server, projects are containers for organizing and securing content. They help manage permissions and structure content hierarchically. Let's define what can be contained:

- * Workbooks: Visualizations and dashboards published to the Server.
- * Data Sources: Published connections or extracts reusable across workbooks.
- * Nested Projects: Sub-projects within a parent project, introduced in later versions (e.g., 2018.2) for deeper organization.
- * Option B (Workbooks): Correct. Workbooks are the primary content type in projects, containing views and dashboards.
- * Option C (Nested Projects): Correct. Nested projects allow hierarchical structuring (e.g., a "Sales" project with "Q1" and "Q2" sub-projects), with inherited or custom permissions.
- * Option D (Data Sources): Correct. Published data sources reside in projects, providing reusable data connections.
- * Option A (Groups): Incorrect. Groups are collections of users managed at the site or server level, not stored within projects.

Projects contain content, not user entities.

Why This Matters: Projects are key to content governance-knowing what they hold helps administrators organize and secure assets effectively.

Reference: Tableau Server Documentation - "Projects" (<https://help.tableau.com/current/server/en-us/projects.htm>).

NEW QUESTION # 23

.....

RealValidExam ensure that the first time you take the exam will be able to pass the exam to obtain the exam certification. Because RealValidExam can provide to you the highest quality analog Salesforce Analytics-Admn-201 Exam will take you into the exam step by step. RealValidExam guarantee that Salesforce Analytics-Admn-201 exam questions and answers can help you to pass the exam successfully.
