

# DOP-C02 Exam Quizzes | Test DOP-C02 Passing Score

## TEST 2A

### – Topic: Jobs / Careers – Nghề nghiệp / Công việc (20 câu dài)

#### What job do you think is the most interesting? Why?

Tôi nghĩ giáo viên là công việc thú vị nhất.  
I think being a teacher is the most interesting job.

Họ có thể giúp học sinh học nhiều điều mới mỗi ngày.  
They can help students learn many new things every day.

Họ không chỉ dạy kiến thức mà còn hướng dẫn học sinh cách trở thành người tốt hơn.  
They not only teach knowledge but also guide students to become better people.

Công việc này cũng mang lại niềm vui.  
This job also brings joy.

Nó mang lại cảm giác thành công khi thấy học sinh tiến bộ.  
It brings a sense of achievement when they see students improving.

#### 1. Do you know someone who works in a hospital? What do they do?

Tôi biết chú tôi làm bác sĩ ở bệnh viện.  
I know my uncle works as a doctor in a hospital.

Chú chữa bệnh cho các bệnh nhân.  
He treats patients.

Chú tư vấn sức khỏe cho họ.  
He gives health advice.

Đôi khi chú phải làm việc rất nhiều giờ trong ngày.  
Sometimes he has to work very long hours.

Tôi rất ngưỡng mộ sự kiên nhẫn và chăm chỉ của chú.  
I really admire his patience and hard work.

Công việc này giúp cứu sống người khác.  
This job helps save lives.

Nó mang lại nhiều lợi ích cho xã hội.  
It brings many benefits to society.

P.S. Free & New DOP-C02 dumps are available on Google Drive shared by Easy4Engine: [https://drive.google.com/open?id=13I0VuCnAuOam9JxBXAbbaUJvw\\_vEZILX](https://drive.google.com/open?id=13I0VuCnAuOam9JxBXAbbaUJvw_vEZILX)

With these adjustable AWS Certified DevOps Engineer - Professional (DOP-C02) mock exams, you can focus on weaker concepts that need improvement. This approach identifies your mistakes so you can remove them to master the AWS Certified DevOps Engineer - Professional (DOP-C02) exam questions of Easy4Engine give you a comprehensive understanding of DOP-C02 Real Exam format. Self-evaluation by taking practice exams makes your Amazon DOP-C02 exam preparation flawless and strengthens enough to crack the test in one go.

You can find features of this Amazon DOP-C02 prep material below. All smart devices are suitable to use Amazon DOP-C02 pdf dumps of Easy4Engine. Therefore, you can open this Amazon DOP-C02 real dumps document and study for the Amazon DOP-C02 test at any time from your comfort zone. These DOP-C02 Dumps are updated, and Easy4Engine regularly amends the content as per new changes in the DOP-C02 real certification test.

## Test DOP-C02 Passing Score | Test DOP-C02 King

Our DOP-C02 study materials are in short supply in the market. Our sales volumes are beyond your imagination. Every day thousands of people browser our websites to select study materials. As you can see, many people are inclined to enrich their knowledge reserve. So you must act from now. The quality of our DOP-C02 Study Materials is trustworthy. We ensure that you will satisfy our study materials. If you still cannot trust us, we have prepared the free trials of the DOP-C02 study materials for you to try.

## Amazon AWS Certified DevOps Engineer - Professional Sample Questions (Q339-Q344):

### NEW QUESTION # 339

A company uses AWS Organizations to manage its AWS accounts. The company has a root OU that has a child OU. The root OU has an SCP that allows all actions on all resources. The child OU has an SCP that allows all actions for Amazon DynamoDB and AWS Lambda, and denies all other actions.

The company has an AWS account that is named vendor-data in the child OU. A DevOps engineer has an IAM user that is attached to the AdministratorAccess IAM policy in the vendor-data account. The DevOps engineer attempts to launch an Amazon EC2 instance in the vendor-data account but receives an access denied error.

Which change should the DevOps engineer make to launch the EC2 instance in the vendor-data account?

- A. Create a new SCP that allows all actions for Amazon EC2. Attach the SCP to the root OU.
- B. **Update the SCP in the child OU to allow all actions for Amazon EC2.**
- C. Create a new SCP that allows all actions for Amazon EC2. Attach the SCP to the vendor-data account.
- D. Attach the AmazonEC2FullAccess IAM policy to the IAM user.

### Answer: B

Explanation:

The correct answer is C. Updating the SCP in the child OU to allow all actions for Amazon EC2 will enable the DevOps engineer to launch the EC2 instance in the vendor-data account. SCPs are applied to OUs and accounts in a hierarchical manner, meaning that the SCPs attached to the parent OU are inherited by the child OU and accounts. Therefore, the SCP in the child OU overrides the SCP in the root OU and denies all actions except for DynamoDB and Lambda. By adding EC2 to the allowed actions in the child OU's SCP, the DevOps engineer can access EC2 resources in the vendor-data account.

Option A is incorrect because attaching the AmazonEC2FullAccess IAM policy to the IAM user will not grant the user access to EC2 resources. IAM policies are evaluated after SCPs, so even if the IAM policy allows EC2 actions, the SCP will still deny them. Option B is incorrect because creating a new SCP that allows all actions for EC2 and attaching it to the vendor-data account will not work. SCPs are not cumulative, meaning that only one SCP is applied to an account at a time. The SCP attached to the account will be the SCP attached to the OU that contains the account. Therefore, option B will not change the SCP that is applied to the vendor-data account.

Option D is incorrect because creating a new SCP that allows all actions for EC2 and attaching it to the root OU will not work. As explained earlier, the SCP in the child OU overrides the SCP in the root OU and denies all actions except for DynamoDB and Lambda. Therefore, option D will not affect the SCP that is applied to the vendor-data account.

### NEW QUESTION # 340

A company uses Amazon RDS for Microsoft SQL Server as its primary database and must ensure cross-Region high availability with RPO < 1 min and RTO < 10 min.

Which solution meets these requirements?

- A. Use Multi-AZ cluster with snapshots copied cross-Region.
- B. **Use RDS Multi-AZ DB cluster with cross-Region read replicas. Automate failover via Route 53.**
- C. Use single-AZ RDS + DMS continuous replication.
- D. Use single-AZ with Backup and restore.

### Answer: B

Explanation:

RDS Multi-AZ cluster deployments with cross-Region read replicas support near real-time replication (<1 min RPO) and fast promotion (<10 min RTO). Route 53 CNAME failover redirects application traffic automatically. This is the AWS-recommended DR pattern.

### NEW QUESTION # 341

A company has a new AWS account that teams will use to deploy various applications. The teams will create many Amazon S3 buckets for application-specific purposes and to store AWS CloudTrail logs. The company has enabled Amazon Macie for the account.

A DevOps engineer needs to optimize the Macie costs for the account without compromising the account's functionality.

Which solutions will meet these requirements? (Select TWO.)

- A. Configure discovery jobs to include S3 objects based on the last modified criterion.
- B. Configure scheduled daily discovery jobs for all S3 buckets in the account.
- C. Configure discovery jobs to include S3 objects that are tagged as production only.
- D. **Exclude S3 buckets that contain CloudTrail logs from automated discovery.**
- E. Exclude S3 buckets that have public read access from automated discovery.

**Answer: A,D**

Explanation:

To optimize the Macie costs for the account without compromising the account's functionality, the DevOps engineer needs to exclude S3 buckets that do not contain sensitive data from automated discovery. S3 buckets that contain CloudTrail logs are unlikely to have sensitive data, and Macie charges for scanning and monitoring data in S3 buckets. Therefore, excluding S3 buckets that contain CloudTrail logs from automated discovery can reduce Macie costs. Similarly, configuring discovery jobs to include S3 objects based on the last modified criterion can also reduce Macie costs, as it will only scan and monitor new or updated objects, rather than all objects in the bucket.

#### NEW QUESTION # 342

A DevOps engineer is building a continuous deployment pipeline for a serverless application that uses AWS Lambda functions. The company wants to reduce the customer impact of an unsuccessful deployment. The company also wants to monitor for issues. Which deploy stage configuration will meet these requirements?

- A. Use AWS CloudFormation to publish a new version on every stack update, and include Amazon CloudWatch alarms on all resources. Use the `RoutingConfig` property of the `AWS::Lambda::Alias` resource to update the traffic routing during the stack update.
- B. Use AWS CloudFormation to publish a new stack update, and include Amazon CloudWatch alarms on all resources. Set up an AWS CodePipeline approval action for a developer to verify and approve the AWS CloudFormation change set.
- C. **Use AWS CodeBuild to add sample event payloads for testing to the Lambda functions. Publish a new version of the functions, and include Amazon CloudWatch alarms. Update the production alias to point to the new version. Configure rollbacks to occur when an alarm is in the ALARM state.**
- D. Use an AWS Serverless Application Model (AWS SAM) template to define the serverless application. Use AWS CodeDeploy to deploy the Lambda functions with the `Canary10Percent15Minutes` Deployment Preference Type. Use Amazon CloudWatch alarms to monitor the health of the functions.

**Answer: C**

Explanation:

Use routing configuration on an alias to send a portion of traffic to a second function version. For example, you can reduce the risk of deploying a new version by configuring the alias to send most of the traffic to the existing version, and only a small percentage of traffic to the new version. <https://docs.aws.amazon.com/lambda/latest/dg/configuration-aliases.html>

The following are the steps involved in the deploy stage configuration that will meet the requirements:

- \* Use AWS CodeBuild to add sample event payloads for testing to the Lambda functions.
- \* Publish a new version of the functions, and include Amazon CloudWatch alarms.
- \* Update the production alias to point to the new version.
- \* Configure rollbacks to occur when an alarm is in the ALARM state.

This configuration will help to reduce the customer impact of an unsuccessful deployment by deploying the new version of the functions to a staging environment first. This will allow the DevOps engineer to test the new version of the functions before deploying it to production.

The configuration will also help to monitor for issues by including Amazon CloudWatch alarms. These alarms will alert the DevOps engineer if there are any problems with the new version of the functions.

#### NEW QUESTION # 343

A large enterprise is deploying a web application on AWS. The application runs on Amazon EC2 instances behind an Application Load Balancer. The instances run in an Auto Scaling group across multiple Availability Zones. The application stores data in an Amazon RDS for Oracle DB instance and Amazon DynamoDB.

There are separate environments for development testing and production.

What is the MOST secure and flexible way to obtain password credentials during deployment?

- A. Retrieve an access key from an AWS Systems Manager `securestring` parameter to access AWS services.

- Retrieve the database credentials from a Systems Manager SecureString parameter.
- B. Retrieve an access key from an AWS Systems Manager plaintext parameter to access AWS services.
- Retrieve the database credentials from a Systems Manager SecureString parameter.
- **C. Launch the EC2 instances with an EC2 1AM role to access AWS services** **Retrieve the database credentials from AWS Secrets Manager.**
- D. Launch the EC2 instances with an EC2 1AM role to access AWS services Store the database passwords in an encrypted config file with the application artifacts.

### Answer: C

Explanation:

Explanation

AWS Secrets Manager is a secrets management service that helps you protect access to your applications, services, and IT resources. This service enables you to easily rotate, manage, and retrieve database credentials, API keys, and other secrets throughout their lifecycle. Using Secrets Manager, you can secure and manage secrets used to access resources in the AWS Cloud, on third-party services, and on-premises. SSM parameter store and AWS Secret manager are both a secure option. However, Secrets manager is more flexible and has more options like password generation. Reference:
