Palo Alto Networks Certified Cybersecurity Practitioner Sample Questions (Q226-Q231):

NEW QUESTION # 226

What are three benefits of the cloud native security platform? (Choose three.)

- A. Flexibility
- B. Agility
- C. Digital transformation
- D. Exclusivity
- E. Increased throughput

Answer: A,B,C

Explanation:

A cloud native security platform (CNSP) is a set of security practices and technologies designed specifically for applications built and deployed in cloud environments. It involves a shift in mindset from traditional security approaches, which often rely on network-based protections, to a more application-focused approach that emphasizes identity and access management, container security and workload security, and continuous monitoring and response. A CNSP offers three main benefits for cloud native applications:

* **Agility:** A CNSP enables faster and more frequent delivery of software updates, as security is built into the application and infrastructure from the ground up, rather than added on as an afterthought. This allows for seamless integration of security controls into the continuous integration/continuous delivery (CI/CD) pipeline, reducing the risk of security gaps or delays. A CNSP also leverages automation and orchestration to simplify and streamline security operations, such as configuration, patching, scanning, and remediation.

* **Digital transformation:** A CNSP supports the adoption of cloud native technologies, such as microservices, containers, serverless, and platform as a service (PaaS), which enable greater scalability, deployability, manageability, and performance of cloud applications. These technologies also allow for more innovation and experimentation, as developers can easily create, test, and deploy new features and functionalities. A CNSP helps to protect these cloud native architectures from threats and vulnerabilities, while also ensuring compliance with regulations and standards.

* **Flexibility:** A CNSP provides consistent and comprehensive security across different cloud environments, such as public, private, and multi-cloud. It also allows for customization and adaptation of security policies and controls to suit the specific needs and preferences of each application and organization. A CNSP can also integrate with other security tools and platforms, such as firewalls, endpoint protection, threat intelligence, and security information and event management (SIEM), to provide a holistic and unified view of the security posture and risk level of cloud applications.

NEW QUESTION # 227

Which two statements apply to the SSL/TLS protocol? (Choose two.)

- A. It is a method used to encrypt data and authenticate web-based communication.
- B. It ensures the data that is transferred between a client and a server remains private.
- C. It provides administrator privileges to manage and control the access of network resources.
- D. It contains password characters that users enter to access encrypted data.

Answer: A,B

Explanation:

SSL/TLS encrypts and authenticates web-based communication to ensure secure data transmission over networks. It ensures privacy by encrypting the data exchanged between a client and a server, protecting it from interception or tampering. It doesn't handle user input like passwords directly.

NEW QUESTION # 228

SecOps consists of interfaces, visibility, technology, and which other three elements? (Choose three.)

- A. Processes
- B. Understanding
- C. Accessibility
- D. Business
- E. People

Answer: A,D,E

Explanation:

The six pillars include:

1. Business (goals and outcomes)
2. People (who will perform the work)
3. Interfaces (external functions to help achieve goals)
4. Visibility (information needed to accomplish goals)
5. Technology (capabilities needed to provide visibility and enable people)
6. Processes (tactical steps required to execute on goals)

All elements must tie back to the business itself and the goals of the security operations

NEW QUESTION # 229

Anthem server breaches disclosed Personally Identifiable Information (PII) from a number of its servers. The infiltration by hackers was attributed to which type of vulnerability?

- A. access by using a third-party vendor's password
- B. an intranet-accessed contractor's system that was compromised
- C. exploitation of an unpatched security vulnerability
- D. a phishing scheme that captured a database administrator's password

Answer: D

Explanation:

The Anthem data breach of 2015 was caused by a phishing scheme that captured a database administrator's password. According to the U.S. Department of Health and Human Services (HHS) Office for Civil Rights (OCR), hackers sent phishing emails to an Anthem subsidiary. At least one employee responded. Attackers were able to plant malware on the company's system and gain remote access to confidential information¹. The breach exposed the electronic protected health information of almost 79 million people, including names, Social Security numbers, medical identification numbers, addresses, dates of birth, email addresses, and employment information². NEW QUESTION # 230

Which two workflows are improved by integrating SIEMs with other security solutions? (Choose two.)

- A. Hardware procurement
- B. Incident response
- C. Log normalization
- D. Initial security team training

Answer: B,C

Explanation:

Log normalization - SIEMs standardize log formats from various sources, making it easier to analyze and correlate security events.
Incident response - Integration enables faster detection, investigation, and automated or guided response to security incidents by using correlated data from multiple tools.

Hardware procurement and security team training are not directly influenced by SIEM integration.
