CrowdStrike Certified Cloud Specialist Sample Questions (Q90-Q95):

NEW QUESTION # 90

When registering a cloud account with Falcon, what is the first required step to ensure the registration process is successful?

- A. Granting CrowdStrike permissions to access the cloud account via an API role or service account.
- B. Synchronizing account metadata with the Falcon Console by uploading a CSV file.
- C. Deploying the CrowdStrike Falcon agent to all cloud workloads.
- D. Activating vulnerability scanning for all container images in the account.

Answer: A

Explanation:

Option A: Deploying the Falcon agent to workloads is not a prerequisite for registering the cloud account. Agent deployment is a separate step focused on workload protection, not account registration.

Option B: There is no requirement to upload metadata via a CSV file during the registration process. Falcon Cloud Security collects metadata automatically once permissions are granted.

Option C: While vulnerability scanning is an important feature of Falcon Cloud Security, it is not a step in the account registration process. Scanning requires additional configurations after registration.

Option D: Granting the necessary permissions through an API role or service account is a critical first step in registering a cloud account with Falcon. Without these permissions, Falcon Cloud Security cannot monitor or secure resources within the account.

NEW QUESTION # 91

A technology company is running a Kubernetes-based microservices architecture deployed across both on-premises data centers and multiple cloud environments, including AWS and Google Cloud. The security team wants a unified solution that provides runtime protection, threat detection, and container visibility across their hybrid cloud infrastructure.

Which CrowdStrike Falcon sensor should they deploy?

- A. Falcon Sensor for Mobile Devices
- B. Falcon Forensic Collection Tool
- C. Falcon Cloud Workload Protection (CWP) Sensor
- D. Falcon Sensor for MacOS

Answer: C

Explanation:

Option A: Falcon CWP is designed to secure containerized workloads across hybrid cloud environments, providing real-time threat detection, runtime protection, and visibility into Kubernetes clusters regardless of where they are deployed. It supports multi-cloud and on-premises deployments, making it the best fit for this scenario.

Option B: This sensor is tailored for Mac endpoint security and does not provide Kubernetes runtime protection. It is intended for user devices rather than containerized environments.

Option C: This tool is useful for post-incident forensic investigations but does not provide proactive runtime protection. It is not intended for continuous security monitoring in Kubernetes environments.

Option D: Mobile security sensors are designed for iOS and Android devices, focusing on mobile endpoint security rather than cloud-native workloads. They do not offer runtime protection for Kubernetes environments.

NEW QUESTION # 92

A security analyst using CrowdStrike Falcon Cloud Workload Protection (CWP) notices unusual outbound traffic from a Kubernetes pod to an unknown external IP. The analyst needs to determine whether the traffic is malicious and identify the process responsible for the connection.

Which CrowdStrike Falcon feature should the analyst use to identify network connections at the process level?

- A. Falcon Sandbox
- B. Falcon Identity Protection
- C. Falcon Sensor Network Visibility
- D. Falcon LogScale

Answer: C

Explanation:

Option A: Falcon LogScale provides log analytics and can collect network event logs, but it does not provide real-time visibility into active network connections at the process level. It is useful for post-incident investigations but not for immediate runtime detection.

Option B: Identity Protection helps detect credential-based attacks and unauthorized access attempts but does not monitor network connections at the process level. It is designed for preventing identity-based threats rather than inspecting runtime network traffic.

Option C: This feature enables deep visibility into network connections at the process level within cloud workloads, including Kubernetes containers. It allows the analyst to identify the specific containerized process making the outbound connection, investigate its behavior, and detect potential threats.

Option D: Falcon Sandbox is used for analyzing suspicious files in an isolated environment to detect malware behavior. It does not monitor active network connections within Kubernetes workloads.

NEW QUESTION # 93

After deploying the Falcon Container Sensor in your Kubernetes cluster, your team wants to understand its primary use cases. Which of the following is a primary function of the Falcon Container Sensor in Kubernetes?

- A. Automatically scaling Kubernetes pods based on security threats.
- B. Encrypting all data stored in Kubernetes Persistent Volumes (PVs).
- **C. Monitoring container runtime activity and detecting malicious behavior.**
- D. Deploying application code to Kubernetes clusters securely.

Answer: C

Explanation:

Option A: The primary function of the Falcon Container Sensor is to monitor container runtime activity, identify anomalies, and detect potential threats or malicious behavior.

Option B: The Falcon Container Sensor does not control pod scaling. Kubernetes itself handles scaling based on resource usage, not security threats.

Option C: The sensor does not encrypt data in Persistent Volumes. Data encryption is managed by the storage provider or Kubernetes itself, not by the Falcon Container Sensor.

Option D: The Falcon Container Sensor is not responsible for deploying application code. It focuses on securing containerized workloads rather than application delivery.

NEW QUESTION # 94

What is the recommended action after CrowdStrike Falcon identifies a potentially malicious network connection in a containerized workload?

- **A. Block the container's network access and perform a forensic investigation of the workload.**
- B. Re-scan the container image used by the workload to identify vulnerabilities.
- C. Automatically restart the affected container to terminate the malicious connection.
- D. Rely on cloud provider firewall logs to verify the nature of the connection.

Answer: A

Explanation:

Option A: Restarting the container might temporarily stop the malicious connection, but it does not address the underlying cause or prevent recurrence.

Option B: While re-scanning the image may identify vulnerabilities, it does not mitigate the immediate threat posed by the malicious connection.

Option C: Cloud firewall logs may provide additional insights but are not sufficient to mitigate the threat or investigate the root cause effectively.

Option D: Blocking network access prevents further malicious activity, while forensic investigation helps identify the root cause, such as exploited vulnerabilities or misconfigurations.
