

Vce Nutanix NCP-BC-7.5 Download, NCP-BC-7.5 Reliable Study Guide

Maybe you are determined to pass the NCP-BC-7.5 exam, but if you want to study by yourself, the efficiency of going it alone is very low, and it is easy to go to a dead end. You really need a helper. Take a look at the development of NCP-BC-7.5 Guide quiz and you will certainly be attracted to it. And you can just free download the demos to try it out. The advantages of NCP-BC-7.5 study materials are numerous and they are all you need!

Nutanix NCP-BC-7.5 certified examinations questions are collected and edited by latest exam teaching program and real test questions materials. We are engaged in updating our training materials constantly. If you are afraid that once you purchase our current version of NCP-BC-7.5 Certified examinations questions, then there is new update version, current version will be out, please rest assured that you can download free our latest version one we release new version within one year.

Nutanix NCP-BC-7.5 Reliable Study Guide & NCP-BC-7.5 Valid Test Sample

More and more people hope to enhance their professional competitiveness by obtaining NCP-BC-7.5 certification. However, under the premise that the pass rate is strictly controlled, fierce competition makes it more and more difficult to pass the NCP-BC-7.5 examination. In order to guarantee the gold content of the NCP-BC-7.5 Certification, the official must also do so. However, it is an indisputable fact that a large number of people fail to pass the NCP-BC-7.5 examination each year, some of them may choose to give it up while others may still choose to insist.

Nutanix Certified Professional - Business Continuity (NCP-BC) 7.5 Sample Questions (Q22-Q27):

NEW QUESTION # 22

An administrator notices that the link between the source and destination clusters gets overutilized during recovery point replication. The company secured a new 10G connection between the two clusters.

What configuration should the administrator use so that the replication traffic uses the new 10G link?

- A. Configure Network Segmentation for Volumes.

- B. Configure Network Segmentation for DR.
- C. Configure Flow Rules.
- D. Configure Backplane Network.

Answer: B

Explanation:

By default, Nutanix clusters use the same management network interface (eth0) for administrative tasks and replication traffic. In high-traffic environments or over narrow WAN links, replication can consume all available bandwidth, impacting management accessibility or other VM traffic. When a new dedicated high-speed link (such as a 10G connection) is added specifically for BCDR, the cluster must be instructed to move its replication traffic to that new path.

The Nutanix solution for this is "Network Segmentation for DR." This feature allows the administrator to define a new, dedicated network for disaster recovery and replication. By configuring segmentation, the administrator assigns a specific virtual interface (typically ntnx0) and a dedicated set of IP addresses for each Controller VM (CVM) on the new 10G link. Once enabled, the Cerebro and Stargate services will bind to these new "segmented" IPs for all site-to-site data transfers. This effectively offloads replication from the management network, ensuring that the 10G link is fully utilized for BCDR while the management network remains stable for administrative tasks. This configuration provides both better performance for replication (meeting aggressive RPOs) and better overall cluster security and stability through traffic isolation.

NEW QUESTION # 23

An administrator is tasked with ensuring the VMs do not experience downtime during an upcoming network maintenance on the primary cluster. The VMs are protected by a Protection Policy and are configured under a Recovery Plan. What failover mechanism should the administrator use to ensure the VMs are available on the target cluster before the maintenance window?

- A. Validate the Recovery Plan
- B. Test Failover
- C. Planned Failover
- D. Unplanned Failover

Answer: C

Explanation:

In a Business Continuity strategy, "downtime" can be categorized as either unexpected (disaster) or controlled (maintenance).

When an administrator knows that a disruption is coming, such as scheduled network maintenance on a primary cluster, they should utilize the "Planned Failover" mechanism within the Nutanix Recovery Plan.

A Planned Failover is a graceful, orchestrated migration. It first shuts down the virtual machines at the primary site to ensure all data is flushed and no new writes occur. It then performs a final synchronization to the recovery site to ensure zero data loss (Zero RPO), and finally powers the VMs on at the destination site according to the plan's sequence. This differs significantly from an "Unplanned Failover" (Option A), which assumes the primary site is already offline and may result in minor data loss depending on the last successful replication. A "Test Failover" (Option D) merely validates the process in an isolated environment and does not move the actual production workload. By executing a Planned Failover before the maintenance begins, the administrator ensures that the services are safely running on the target cluster, maintaining application availability and meeting the objective of zero downtime during the maintenance window.

NEW QUESTION # 24

A third-party backup solution is configured to use Nutanix application-consistent snapshots. Backups are failing for several Windows VMs, although crash-consistent snapshots succeed.

What is the most likely cause of the failure?

- A. The protection policy uses asynchronous replication.
- B. Bandwidth throttling is configured too low.
- C. Replication traffic encryption is disabled.
- D. NGT is not installed or not communicating.

Answer: D

Explanation:

Nutanix supports two main types of snapshots: crash-consistent and application-consistent. A crash-consistent snapshot is taken at the storage layer without any awareness of the guest OS state; it is equivalent to pulling the power plug on a server. An application-

consistent snapshot is more complex because it requires the Nutanix cluster to "quiesce" the applications (such as SQL Server or Exchange) inside the guest OS, flushing pending writes to disk to ensure data integrity.

To perform this quiescence on Windows VMs, the Nutanix cluster must communicate with the Windows Volume Shadow Copy Service (VSS). This communication is handled exclusively by Nutanix Guest Tools (NGT). If NGT is not installed on the VM, or if the NGT agent is not running/communicating with the cluster, the system cannot trigger the VSS hardware provider. In this situation, any request for an "application-consistent" snapshot from a third-party backup solution will fail because the cluster lacks the necessary hooks into the guest OS. However, a "crash-consistent" snapshot will still succeed because it does not require any guest-level interaction. Therefore, when app-consistent backups fail but crash-consistent ones succeed, the most likely root cause is a missing or broken NGT installation on the affected virtual machines.

NEW QUESTION # 25

While attempting to execute a Commvault backup plan, an administrator received the following error for several VMs: "Virtual Machine not found". After confirming the VMs exist, the administrator finds the following related error message: "Event Code 91:4 Virtual machine [Nutanix-Web-Server] was not found."

Please verify that the virtual machine still exists and that the host is in the connected state. Which action should the administrator take to enable successful backups?

- A. Ensure the VM is created with local Key Management Server (KMS).
- B. Ensure Virtual Trusted Platform Module (vTPM) is disabled on the VMs.
- C. Upgrade Nutanix Guest Tools (NGT) on the VM to the latest version.
- D. Ensure primary and recovery clusters are not registered to the same KMS.

Answer: C

Explanation:

Nutanix integration with third-party backup vendors like Commvault often relies on the Nutanix Guest Tools (NGT) to facilitate advanced backup features. NGT provides the necessary communication bridge between the guest VM's internal state and the Nutanix AOS storage layer. The "Virtual Machine not found" error in a Commvault context, despite the VM being visible in Prism, often indicates a breakdown in metadata communication or a mismatch in the guest agent's version.

If NGT is outdated or its internal "Nutanix Guest Agent" (NGA) service is failing, the backup software may be unable to retrieve the correct VM UUID or state information required to initiate an application-consistent snapshot. Upgrading NGT to the latest version ensures that the guest VM has the most current VSS hardware providers and metadata handlers, which are required for modern backup orchestration. Furthermore, NGT upgrades often resolve internal registration issues where the cluster fails to recognize the VM's active state due to legacy driver conflicts. By ensuring the NGT version is current and the NGA service is healthy, the administrator establishes a reliable communication path, allowing Commvault to correctly identify and process the VM for backup operations. This highlights the importance of maintaining NGT as part of regular cluster maintenance to ensure consistent BCDR functionality.

NEW QUESTION # 26

An administrator executes an Unplanned Failover of web server VMs from an on-premises AZ to a Nutanix Cloud Cluster (NC2) on AWS. The Recovery Plan completes, and the VMs are running. However, external users cannot access the websites hosted on these VMs. The administrator verifies that the firewall rules are set correctly. What specific configuration is required for these VMs to be reachable from the external network after failover to NC2?

- A. The administrator must enable Promiscuous Mode on the NC2 virtual switch.
- B. A VPN connection must be established between the NC2 cluster and the external users.
- C. The VMs must be migrated to a stretched L2 subnet.
- D. Floating IP addresses must be configured for the guest VMs.

Answer: D

Explanation:

Failing over to Nutanix Cloud Clusters (NC2) on AWS involves moving workloads from a local, on-premises networking environment into a cloud-native Virtual Private Cloud (VPC). While Nutanix Flow Virtual Networking (FVN) allows the VMs to keep their internal IP addresses using overlay networks, external visibility requires integration with AWS networking components. Standard internal IP addresses in an overlay network are not natively routable from the public internet or from the AWS VPC outside of the NC2 cluster. To bridge this gap, Nutanix uses "Floating IPs". A Floating IP is an AWS Elastic IP that is mapped to the internal IP of the guest VM. When an external user attempts to reach the website, the traffic hits the AWS public-facing Floating IP, which is then translated and routed through the NC2 bare-metal nodes to the specific guest VM. This mapping can be automated

as part of the Recovery Plan or configured manually post-failover. Without this configuration, the VMs will remain "isolated" from external traffic, even if the application is running perfectly and internal cluster connectivity is healthy. This demonstrates the importance of cloud-native networking knowledge when extending on-premises BCDR plans into public cloud environments like NC2.

NEW QUESTION # 27

.....

With the development of society and the perfection of relative laws and regulations, the NCP-BC-7.5 certificate in our career field becomes a necessity for our country. Passing the NCP-BC-7.5 and obtaining the certificate may be the fastest and most direct way to change your position and achieve your goal. And we are just right here to give you help. Being considered the most authentic brand in this career, our professional experts are making unremitting efforts to provide our customers the latest and valid NCP-BC-7.5 Exam simulation.

NCP-BC-7.5 Reliable Study Guide: https://www.itcertkey.com/NCP-BC-7.5_braindumps.html

From your first contact with our NCP-BC-7.5 practice guide, you can enjoy our excellent service. Our purchase process is of the safety and stability if you have any trouble in the purchasing NCP-BC-7.5 practice materials or trail process, you can contact us immediately. We totally understand your mood to achieve success at least the NCP-BC-7.5 exam questions right now, so our team makes progress ceaselessly in this area to make better NCP-BC-7.5 study guide for you. Nutanix Vce NCP-BC-7.5 Download. If you have any questions on the exam question and answers, we will help you solve it.

Stage One is to define your target, Bitcoin Is Longer for Payments. From your first contact with our NCP-BC-7.5 practice guide, you can enjoy our excellent service.

Our purchase process is of the safety and stability if you have any trouble in the purchasing NCP-BC-7.5 practice materials or trail process, you can contact us immediately.

2026 NCP-BC-7.5: Accurate Vce Nutanix Certified Professional - Business Continuity (NCP-BC) 7.5 Download

We totally understand your mood to achieve success at least the NCP-BC-7.5 exam questions right now, so our team makes progress ceaselessly in this area to make better NCP-BC-7.5 study guide for you.

If you have any questions on the exam question and answers, we will help you solve NCP-BC-7.5 it. The software and hardware components that are needed in successfully implementing the above mentioned procedure are also taught during the training.
