You can also know how to contact us and what other client's evaluations about our Drupal-Site-Builder test braindumps. The pages of our product also provide other information about our product and the exam.

Acquia Certified Drupal Site Builder Exam for Drupal 10, 11 Sample Questions (Q44-Q49):

NEW QUESTION # 44

A "Hotel Review" content type includes an entity reference field, "field_related_hotel," to associate each Hotel Review with a "Hotel" node. You are asked to add a sidebar block to the Hotel node display that shows a list of related reviews.

How can you build this functionality?

- A. Create a View of Hotel Review nodes, with a relationship to content referenced from field_related_hotel, and a contextual filter by ID using the relationship, set to use "Content ID from URL". Add the block to the Hotel nodes display.
- B. Add "field_related_hotel" to the Hotel content type and use css to display the field in the sidebar region.
- C. Add the "show related content" block to the Hotel nodes display. Set it to include only nodes of type

"Hotel Review"

- D. Create a view of Hotel nodes, with a relationship to field_related_hotel, and add the title field using the relationship. Add the block to the Hotel nodes display.

Answer: A

Explanation:

The correct Drupal site-building approach is to create a View of Hotel Review content and filter it dynamically based on the currently viewed Hotel node . Drupal's Views documentation explains that contextual filters are used when a view should change depending on the current context, such as the URL or current page. It also notes that when the filter is based on related data rather than the base table alone, you may need to add a relationship first.

Here, the base content is Hotel Review nodes, and those reviews point to a Hotel through the entity reference field field_related_hotel . So the View should add the relationship to the referenced Hotel node, then use a Content: ID contextual filter on that relationship, with the default value set to Content ID from URL . This makes the block show only reviews whose referenced hotel matches the Hotel node currently being displayed.

That is exactly what option A describes. The other options either use the wrong base content, rely on CSS instead of Views logic, or refer to a generic block that does not provide this relationship-based filtering behavior.

NEW QUESTION # 45

You have installed a contributed module called "Sample Module" that looks like it will be a great fit for the business case you are trying to solve. However, upon closer examination, it looks like the module only supplies a drush command; it does not have an admin interface.

As a site builder with no command-line experience, this will not work for you! You need a web user interface to use this module. How should you request a web UI in the module's issue queue?

- A. Create a "Feature Request" issue for the module with the subject line, "Create web UI for Sample Module."
- B. Create a "Plan" issue for the module with the subject line, "Create web UI for Sample Module."
- C. Create a "Feature Request" issue for the module with the subject line, "URGENT: Module Broken!!!Needs UI."
- D. Create a "Bug Report" issue for the module with the subject line, "Create web UI for Sample Module."

Answer: A

Explanation:

Drupal's issue queue guidelines clearly distinguish between different issue types. A Bug Report is used when existing functionality is broken or not working as intended. In this case, the module is functioning correctly- it simply does not provide a UI-so option A is incorrect.

A Feature Request is the correct issue type when asking for new functionality or enhancements to an existing module. Requesting a web-based UI for a module that currently only provides Drush commands is a classic example of a feature enhancement, making option C correct.

Option B ("Plan") is typically used for outlining larger initiatives or coordinated development efforts, not for requesting a specific feature. Option D is incorrect because Drupal issue queue best practices emphasize clear, descriptive, and professional issue titles , avoiding urgency or misleading wording like "Module Broken!!!" when it is not actually broken.

Drupal.org documentation encourages contributors to categorize issues properly and write clear, concise summaries so maintainers and the community can effectively review and respond. Therefore, submitting a Feature Request with a clear subject line is the correct and recommended approach.

NEW QUESTION # 46

You manage an online store which sells digital photos. The site hosts thousands of photos from multiple categories. Each photo has a unique description. Your client has specified that the photo description should be stored along with the image file while adding images to the photo content type. The images can be reused on other pieces of content like landing pages, blog posts etc.

How will you build the functionality to store image descriptions along with images? (Select 2 options)

- A. Search for the contributed module for adding image descriptions, as Drupal can't provide this feature out of box.
- B. Create a media type with an image and the description field. Use the media reference field to link this with the content.
- C. Add description field to the pre-existing image media type. Use the media reference field to link this with content.
- D. Create a content type which will have an image and description field, and link this to any content using the entity reference field.

Answer: B,C

Explanation:

Drupal's recommended solution for reusable images with their own metadata is to use Media entities, not ordinary image fields on content. Core documentation and issue work around Media in Drupal explain that moving from regular image fields to media image fields is what enables reuse of the same image asset across multiple pieces of content.

That means the description should live on the media item itself, together with the image, and content types should reference that media item through a media reference field. Drupal field documentation also confirms that fields can be attached to entities and reused appropriately through references. So creating a new media type with an image field plus a description field is valid, and adding a description field to an existing Image media type is also valid. Both approaches satisfy the requirement that the image and its description stay together and can be reused elsewhere.

Option B is incorrect because Drupal core already provides Media for this use case. Option C is not the best content model because a content type represents publishable content, while reusable images-with-metadata are better modeled as Media assets.

NEW QUESTION # 47

You have a Corporate site where all traffic is anonymous. On the site, you have been getting thousands of user registrations every day. You notice that most of the registrations are spam.

What will you do to prevent this?

- A. Set the personal contact form for new users to disabled, and set email verification to use the personal contact form method.
- B. Add user/password in your .htaccess, so that only people who know the credentials can access your site and create an account.
- C. Set "Who can register accounts" to "Administrators only," and assign the task of new account creation to site admins.
- D. Set "Who can register accounts" to "Visitors," and check "Enable password strength indicator."

Answer: C

Explanation:

For a corporate site where public visitors do not need self-service accounts, the correct Drupal site-building solution is to disable visitor registration. Drupal's official User Guide for Configuring User Account Settings says to go to Configuration > People > Account settings and, under Registration and cancellation, select

"Administrators only" as the people with permission to register user accounts. This turns off public account creation and is the standard Drupal method for stopping spam registrations on sites that do not need open sign-up.

The other choices do not match Drupal's documented account-management approach. Option B still allows visitors to create accounts, so it does not prevent spam registrations; a password strength indicator is unrelated to blocking bot sign-ups. Option A would protect the entire site at the web-server level, which is not the intended Drupal account-registration setting and would block all anonymous access, contradicting the site's normal public use. Option D refers to unrelated contact-form behavior and does not control account creation.

Drupal's account settings documentation specifically identifies "Administrators only" as the way to stop visitor registration, making C the verified answer.

NEW QUESTION # 48

A page has been added for a new product, and the marketing team wants you to add it to the main navigation menu, as a child of the "Products" page. During a promotion period, the team also wants you to add a link to the new page as a child of the "What's New" page.

What is the best way to add both links to the main navigation menu?

- A. Edit the new page and create two links in the Menu Settings section, one with "Products" as the parent page and the other with "What's New" as the parent page. When the promotion is over, delete the second menu link.
- B. Edit the new page, add a link in Menu Settings, and select "Products" as the Parent item. Clone the new page, and set the menu link parent to the "What's New" page. When the promotion is over, delete the cloned page.
- C. Edit the new page, add a link in Menu Settings, and select "Products" as the Parent item. In the Main navigation menu, add a new link to the page and select "What's New" as the parent item. When the promotion is over, delete the second link from the menu.
- D. In the Main navigation menu, add two links to the new page, one with "Products" as the parent page and the other with "What's New" as the parent page. Set the second link to expire on the date the promotion ends.

Answer: C

Explanation:

In Drupal 10 and Drupal 11, each content item (node) can only have one menu link created through its Menu settings. Drupal documentation explains that the Menu settings section allows you to place a node in a menu, but only as a single menu item. Therefore, you cannot create two menu links for the same node directly from the node edit form, which makes option D incorrect. The correct approach is to create one menu link via the node's Menu settings (placing it under "Products"), and then manually add an additional menu link in the Menu administration (Structure # Menus # Main navigation) that points to the same node but is placed under "What's New." This matches option A. After the promotion, the temporary menu link can be removed. Option B is incorrect because duplicating content creates unnecessary redundancy and breaks content management best practices. Option C is incorrect because Drupal core does not provide a built-in "menu link expiration" feature. Thus, Drupal's recommended method is to create one menu link via the node and another manually via the menu UI, making A the correct answer.

NEW QUESTION # 49

.....

If you want to constantly improve yourself and realize your value, if you are not satisfied with your current state of work, if you still spend a lot of time studying and waiting for Drupal-Site-Builder qualification examination, then you need our Drupal-Site-Builder material, which can help solve all of the above problems. I can guarantee that our study materials will be your best choice. Our Drupal-Site-Builder Study Materials have three different versions, including the PDF version, the software version and the online version.
