Salesforce Certified MuleSoft Integration Associate Exam Sample Questions (Q16-Q21):

NEW QUESTION # 16
A developer needs to discover which API specifications have been created within the organization before starting a new project
Which Anypoint Platform component can the developer use to find and try out the currently released API specifications?

- A. API Manager
- B. Runtime Manager
- C. Object Store
- D. Anypoint Exchange

Answer: D

Explanation:
When a developer needs to discover which API specifications have been created within the organization before starting a new project, Anypoint Exchange is the component to use. Here's a detailed explanation:
* Anypoint Exchange:
* Purpose: Provides a centralized repository where developers can find and access API specifications, connectors, templates, and other reusable assets.
* API Specifications: Developers can search for API specifications defined using RAML or OAS, review their details, and try them out using provided mock services.
* Capabilities:
* Search and Discovery: Easily search for and discover existing API specifications within the organization.
* Try Out APIs: Provides tools to interact with and test APIs directly from the Exchange, allowing developers to understand the API's functionality and behavior.
* Documentation: Access detailed documentation and examples for each API specification.

NEW QUESTION # 17
An organization is choosing between API-led connectivity and other integration approaches According to MuleSoft which business benefit is associated with an API-led connectivity approach using Anypoint Platform?

- A. Increased developer productivity through self-service of API assets
- B. Higher outcome repeatability through centralized development
- C. Greater project predictability through tight coupling of systems
- D. Improved security through adoption of monolithic architectures

Answer: A

Explanation:
API-led connectivity is an approach that emphasizes the reuse of APIs to enhance agility and productivity.
Here's a detailed explanation of the associated business benefits:
* Self-Service of API Assets:
* Definition: API-led connectivity enables developers to discover, access, and use APIs through a centralized platform like Anypoint Exchange, promoting self-service.
* Productivity: Developers can quickly find and integrate existing APIs, reducing the time and effort required to build new functionalities from scratch.
* Business Benefits:
* Reusability: Encourages the reuse of APIs across projects, leading to faster development cycles and reduced duplication of efforts.
* Agility: Enhances the ability to respond to changing business needs by providing a flexible and modular integration framework.
* Scalability: Facilitates the scaling of integration solutions as business requirements grow.

NEW QUESTION # 18
Which component of AnypointPlatform belongs to the platform control plane"?

- A. Runtime Replica
- B. Anypoint Connectors
- C. Runtime Fabric
- D. API Manager

Answer: D

Explanation:
In Anypoint Platform, the control plane is responsible for managing and controlling the various components and services that make up the platform. API Manager is part of the control plane, providing centralized management of APIs. Here's a detailed explanation:

* Control Plane:
* Definition: The control plane in Anypoint Platform is responsible for the management, monitoring, and control of APIs, applications, and other platform resources.
* Components: Includes tools for API management, analytics, security, and governance.
* API Manager:
* Purpose: Allows users to manage API policies, monitor API usage, and secure APIs. It provides a centralized interface for managing the entire lifecycle of APIs.
* Features:
* Policy Enforcement: Apply security policies, rate limiting, and other governance rules.
* Analytics and Monitoring: Track API performance, usage statistics, and detect anomalies.
* Access Control: Manage user access and permissions for APIs.

NEW QUESTION # 19

What is a defining characteristic of an Integration-Platform-as-a-Service (iPaaS)?

- A. On-premises
- B. Cloud-based
- C. Code-first
- D. No-code

Answer: B

Explanation:
An Integration-Platform-as-a-Service (iPaaS) is characterized by being a cloud-based solution that provides tools to develop, execute, and manage integration flows connecting multiple applications and data sources.
Here's a detailed explanation:
* iPaaS:
* Definition: A suite of cloud services enabling the development, execution, and governance of integration flows.
* Deployment: Delivered and managed entirely in the cloud, offering high availability and scalability.
* Characteristics:
* Cloud-based: The platform is hosted on the cloud, allowing users to access and utilize the integration tools from anywhere with an internet connection.
* Managed Services: iPaaS providers handle infrastructure maintenance, updates, and security, freeing users to focus on integration development.
* Scalability: Easily scales to meet the demands of growing businesses without requiring additional on-premises infrastructure.

NEW QUESTION # 20

An IT integration team followed an API-led connectivity approach to implement an order-fulfillment business process It created an order processing API that coordinates stateful interactions with a variety of microservices that validate, create and fulfill new product orders.
Which interaction composition pattern did the integration architect who designed this order processing API use?

- A. Multicasting
- B. Orchestration
- C. Streaming
- D. Aggregation

Answer: B

Explanation:
In an API-led connectivity approach, different APIs are layered to provide modular and reusable services. For an order processing API that coordinates stateful interactions with various microservices, the integration architect used the orchestration interaction composition pattern. Here's a step-by-step explanation:

* Understanding Orchestration:
* Definition: Orchestration involves coordinating multiple services to achieve a complex business workflow. Unlike choreography, which relies on each service knowing its part, orchestration uses a central controller to manage the interactions.
* Role of the Orchestrator: The orchestrator manages the execution sequence, handles the state, and ensures all the necessary steps are completed successfully.
* Order Processing API:
* API-Led Connectivity: An order processing API, following API-led connectivity, sits in the Process layer, handling complex business processes and logic.
* Stateful Interactions: Orchestration is particularly suitable for stateful interactions where the process needs to remember the state between steps, such as validating an order, creating it, and fulfilling it.
* Implementation Steps:
* Microservices Interaction: The order processing API interacts with various microservices:
* Validation Microservice: Checks the validity of the order details.
* Creation Microservice: Creates the order in the system.
* Fulfillment Microservice: Manages the order fulfillment process.
* Coordination: The API orchestrates these steps, ensuring each one completes successfully before moving to the next, handling exceptions, and maintaining the state of the process.
