Pure Storage Pure Certified Portworx Enterprise Professional (PEP) Exam Sample Questions (Q22-Q27):

NEW QUESTION # 22

A cluster administrator wants to define an Autopilot rule for Portworx. What are the 4 main parts of an Autopilot rule?

- A. Enforcement, Match Expressions, Topology Key and Weight
- **B. Selector, Namespace Selector, Conditions and Actions**
- C. Replica, I/O profile, Secure, Placement Strategy

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

An Autopilot rule in Portworx consists of four main parts: Selector, Namespace Selector, Conditions, and Actions. The Selector defines the set of volumes or pods the rule applies to, often using labels. Namespace Selector further narrows the scope to specific Kubernetes namespaces, allowing targeted policy application. Conditions specify triggers or thresholds such as capacity utilization, I/O metrics, or time-based schedules. When conditions are met, the Actions section defines automated responses such as volume expansion, migration, or alerting. This modular rule design enables flexible, policy-driven automation for storage management, helping maintain cluster health and performance without manual intervention. The Portworx Autopilot documentation provides detailed schema and examples, emphasizing these components as foundational for dynamic, autonomous cluster operation **【Pure Storage Portworx Autopilot Guide source】** .

NEW QUESTION # 23

If a Portworx node is down and the Kubernetes cluster is healthy, which command should be used to check Portworx alerts on a healthy node?

- A. journalctl -Ifu portworx*
- B. kubectl describe node
- **C. pxctl alerts show**

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To check Portworx-specific alerts on a healthy node, administrators use the command `pxctl alerts show`. This command displays current alerts raised by Portworx, including warnings and critical notifications about storage, nodes, and cluster health. Even if one node is down, alerts from the healthy nodes can provide insights into cluster-wide issues or the status of the affected node. While `journalctl` displays system and service logs and `kubectl describe node` shows Kubernetes node info, neither provides aggregated Portworx alert data. The Portworx observability documentation recommends using `pxctl alerts show` for focused monitoring and alert management, enabling administrators to respond effectively to operational events within the Portworx cluster **【Pure Storage Portworx Monitoring Guide source】** .

NEW QUESTION # 24

An application team is preparing to deploy an ElasticSearch application and wants all Portworx volumes created in 6 specific Kubernetes nodes.

Which Portworx feature should they use to achieve this?

- A. Autopilot
- **B. Volume placement strategy**
- C. Stork

Answer: B

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

To ensure Portworx volumes for an ElasticSearch application are created only on specific Kubernetes nodes, the Volume Placement Strategy feature is used. This feature allows administrators to define node affinity or anti-affinity rules that restrict volume provisioning to a subset of nodes. By tagging the six nodes with appropriate labels and configuring the StorageClass or volume parameters to respect these labels, Portworx guarantees that volumes will only be provisioned on those nodes. This targeted volume placement is critical for performance optimization, data locality, and compliance with infrastructure constraints. Autopilot automates scaling and Stork manages storage-aware scheduling but does not directly control volume node placement. The Portworx deployment documentation highlights Volume Placement Strategy as the tool for precise volume-to-node mapping in Kubernetes clusters **【Pure Storage Portworx Deployment Guide source】** .

NEW QUESTION # 25

What option can a Portworx administrator use to perform snapshots of Rep1 2 or 3 volumes when there is limited space on the cluster and no Object Store is configured?

- A. Cloud Snapshot
- B. Local Snapshot
- **C. Skinny Snapshot**

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Skinny Snapshots are a space-efficient snapshot technique used by Portworx for replicated volumes (Rep1 2 or 3) when storage capacity is limited and no external Object Store is configured. Unlike full snapshots that duplicate data blocks, skinny snapshots capture only the differences (deltas) since the last snapshot, minimizing space consumption. This method allows administrators to take frequent snapshots without significantly impacting storage availability. Skinny Snapshots are particularly useful for on-premises environments or clusters without access to cloud object storage, balancing snapshot granularity with resource constraints. Official Portworx snapshot documentation explains how skinny snapshots work internally, improving backup and recovery capabilities under tight storage conditions without requiring cloud integration **【Pure Storage Portworx Snapshot Guide source】** .

NEW QUESTION # 26

What are the two components of Stork?

- A. Stork snapshots and restores

- B. Stork object store and S3 bucket
- C. Stork scheduler and an extender

Answer: C

Explanation:

Comprehensive and Detailed Explanation From Exact Extract:

Stork (Storage Orchestrator for Kubernetes) is a Portworx utility designed to improve Kubernetes storage orchestration. Its two main components are the Stork scheduler and the Stork extender. The scheduler works by placing pods in Kubernetes clusters based on storage constraints, such as volume affinity and anti-affinity, improving application resiliency and data locality. The extender integrates with Kubernetes' default scheduler, influencing pod scheduling decisions to respect storage policies and optimize workload placement. Together, these components enable advanced features such as application-aware migration, snapshot management, and backup coordination. Portworx documentation explains that Stork's design helps maintain stateful application availability during scaling, upgrades, or disaster recovery scenarios by making Kubernetes scheduling storage-aware **【Pure Storage Portworx Stork Guide source】**.
