Palo Alto Networks XSOAR Engineer Sample Questions (Q192-Q197):

NEW QUESTION # 192

Which two behaviors occur while an incident is closed? (Choose two.).

- A. Running timers are in a paused state.
- B. Timers can no longer run.
- C. Playbook is marked as complete.
- D. Commands cannot be executed in the War Room.

Answer: B,C

Explanation:

The XSOAR Timers/SLA documentation states that when an incident reaches the Closed state, all timers automatically stop and cannot continue unless manually reset. Timers do not pause - they terminate.

Additionally, when an incident is closed, its associated playbook completes, because closure marks the end of the investigation lifecycle.

NEW QUESTION # 193

In which two options can an automation script be executed? (Choose two.)

- A. War room
- B. Engine
- C. Playbook
- D. Integration

Answer: A,C

NEW QUESTION # 194

A temporary integration issue causes a scheduled job to fail continuously. Which action will ensure the job continues to run after future failures?.

- A. Adjust the Role-Based Access Control (RBAC) of the incident type.
- **B. Verify that the "Continue on Error" box is checked in the job.**
- C. Ensure the last playbook task runs closeInvestigation.
- D. Edit Queue Handling settings of the job.

Answer: B

Explanation:

Jobs in XSOAR run playbooks or scripts automatically at scheduled intervals. According to the Job Execution section of the Admin Guide, if a job encounters an error during playbook execution, its continued operation depends on whether "Continue on Error" is enabled. When this checkbox is selected, the job will not terminate due to an exception or integration failure. Instead, it logs the error and proceeds to the next scheduled execution as normal.

Queue handling settings (A) apply to indicators/job queues within feeds, not job failure behavior. RBAC changes (C) do not influence job execution continuity. Ensuring the last task closes the investigation (D) is unrelated and may even disrupt job workflows, since jobs often do not require incident-based models.

By contrast, enabling Continue on Error is the documented mechanism that prevents scheduled jobs from halting due to transient or recurring errors. It ensures operational resilience, especially during integration outages or API rate limits. Thus, option B is the correct and fully documented answer.

NEW QUESTION # 195

Which two methods will allow data to be saved in incident fields within a playbook? (Choose two.)

- **A. setIncident**
- B. setFields
- C. Layout inline editing
- **D. Field mapping**

Answer: A,D

NEW QUESTION # 196

A breakpoint is added to a saved playbook to ensure that it pauses before running the task "ad-delete-user." However, it is later discovered that an Active Directory account was deleted by this playbook, and the playbook did not pause at the breakpoint. What is the cause of this issue?.

- A. The playbook was not set to "quiet mode."
- B. The task was not set to "skip."
- C. The task was not configured to override input.
- **D. The playbook does not stop at the breakpoint when run from an incident.**

Answer: D

Explanation:

The XSOAR Playbook Debugger documentation states that breakpoints only apply when the playbook is run in Debug mode, not when an incident triggers the playbook normally.

Running from an incident executes the playbook without debugger controls, so breakpoints are ignored- leading to the deletion task running normally.
