

2026 Confluent CCDAK Unparalleled Best Vce

P.S. Free 2026 Confluent CCDAK dumps are available on Google Drive shared by LatestCram: https://drive.google.com/open?id=1XwnAMJp-il6Awe8ThQ-FFT_t6ThBMphP

If you purchasing our CCDAK simulating questions, you will get a comfortable package services afforded by our considerate after-sales services. We respect your needs toward the useful CCDAK practice materials by recommending our CCDAK Guide preparations for you. And we give you kind and professional supports by 24/7, as long as you can have problems on our CCDAK study guide, then you can contact with us.

Apache Kafka has emerged as a leading distributed streaming platform in the market, providing real-time data processing for businesses across a range of industries. As more organizations adopt Kafka, the demand for skilled Kafka developers has grown significantly. To meet this demand, Confluent has introduced the Confluent Certified Developer for Apache Kafka (CCDAK) Certification Exam, which aims to validate the proficiency of developers in Kafka development.

The Confluent CCDAK Exam covers various topics, including Kafka architecture, messaging patterns, configuration, security, and performance tuning. Developers who pass the exam will demonstrate their ability to develop and deploy high-performance, reliable, and scalable Kafka applications that meet the needs of modern data-driven businesses. Confluent Certified Developer for Apache Kafka Certification Examination certification is an excellent way for developers to showcase their expertise in Kafka and differentiate themselves in the job market.

Valid Confluent CCDAK Exam Simulator, CCDAK Test Study Guide

There is no doubt that having a CCDAK certificate is of great importance to our daily life and daily work, it can improve your comprehensive strength when you are seeking for a decent job or competing for an important position, mainly because with CCDAK Certification, you can totally highlight your resume and become more confident in front of your interviewers and competitors. In this case, our CCDAK question torrent can play a very important part in helping you achieve your dream.

The Confluent CCDAK exam consists of 60 multiple-choice questions that must be completed within 90 minutes. The questions are designed to assess your in-depth knowledge of Kafka and its ecosystem. CCDAK Exam is available in English, Japanese, and Chinese languages, and it can be taken online or in-person at a testing center.

Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q70-Q75):

NEW QUESTION # 70

You have a topic t1 with six partitions. You use Kafka Connect to send data from topic t1 in your Kafka cluster to Amazon S3. Kafka Connect is configured for two tasks. How many partitions will each task process?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

When using Kafka Connect with sink connectors (like S3 Sink), each task is assigned one or more topic partitions. The total number of partitions (6) is evenly distributed across the available tasks (2). Thus, each task will handle 3 partitions.

From Kafka Connect Documentation:

"Kafka Connect divides the topic partitions among available tasks. For example, a topic with six partitions and two tasks results in each task handling three partitions." Reference: Kafka Connect Concepts > Tasks and Partitions

NEW QUESTION # 71

What are three built-in abstractions in the Kafka Streams DSL? (Select three.)

- A. StreamTable
- B. GlobalKStream
- C. KStream
- D. KTable
- E. GlobalKTable

Answer: C,D,E

Explanation:

The Kafka Streams DSL provides three primary abstractions:

KStream: Represents an unbounded stream of records (append-only).

KTable: Represents a changelog stream where each key has the latest value (like a materialized view).

GlobalKTable: A fully replicated version of KTable across all stream instances, enabling global joins.

From Kafka Streams Developer Guide:

"Kafka Streams provides three core abstractions: KStream, KTable, and GlobalKTable, each serving different purposes in stream processing and joins." GlobalKStream and StreamTable do not exist in Kafka's API.

Reference: Kafka Streams Concepts > KStream, KTable, GlobalKTable

NEW QUESTION # 72

(You create a topic with five partitions.

What can you assume about messages read from that topic by a single consumer group?)

- A. Messages from one partition can be consumed by any of the consumers in a group for faster processing.
- B. Messages can be consumed by a maximum of five consumers in the same consumer group.
- C. All messages will be read from exactly one broker by the consumer group.
- D. The consumer group can only read the same number of messages from all the partitions.

Answer: B

Explanation:

The Apache Kafka documentation explains that Kafka's parallelism model is based on topic partitions and consumer groups. Within a single consumer group, each partition can be assigned to at most one consumer at a time. As a result, the maximum level of parallelism for a consumer group is equal to the number of partitions in the topic.

In this scenario, the topic has five partitions, which means that up to five consumers in the same consumer group can actively consume data in parallel. If more than five consumers are added, the extra consumers will remain idle because there are no additional partitions to assign.

Option B is incorrect because Kafka does not enforce equal message consumption across partitions; message distribution depends on producers and partitioning strategy. Option C is false because partitions may be hosted on different brokers, and consumers fetch data from multiple brokers. Option D is incorrect because a single partition cannot be consumed by multiple consumers within the same group simultaneously.

Therefore, the only valid assumption is that a maximum of five consumers can actively consume messages in the same consumer group.

NEW QUESTION # 73

A Zookeeper ensemble contains 5 servers. What is the maximum number of servers that can go missing and the ensemble still run?

- A. 0
- B. 1
- C. 2
- D. 3

Answer: A

Explanation:

majority consists of 3 zk nodes for 5 nodes zk cluster, so 2 can fail

NEW QUESTION # 74

Which configuration allows more time for the consumer poll to process records?

- A. `fetch.max.wait.ms`
- B. `heartbeat.interval.ms`
- C. `session.timeout.ms`
- D. `max.poll.interval.ms`

Answer: D

Explanation:

`max.poll.interval.ms` defines the maximum delay between invocations of `poll()` before the consumer is considered failed. It essentially gives consumers more time to process records before needing to poll again.

From Kafka Consumer Configuration Reference:

"`max.poll.interval.ms`: The maximum delay between invocations of `poll()` when using consumer group management. If `poll()` is not called before expiration, the consumer is considered failed." `session.timeout.ms` and `heartbeat.interval.ms` relate to group coordination and heartbeats.

`fetch.max.wait.ms` affects how long the broker waits to accumulate data before sending a fetch response.

Reference: Apache Kafka Consumer Configs
