NEW QUESTION # 25

Refer to Exhibit:

You notice that your site events show an unresponsive DHCP server in your network. You want to analyze the event by using the dynamic packet capture.

Referring to the exhibit, how would you access the packet capture for further analysis in Wireshark?

- A. Verify the impacted client and use the corresponding client event to fetch the automatically generated packet capture.
- **B. Verify the impacted site and use the corresponding site event to fetch the automatically generated packet capture.**
- C. Verify the impacted client and use the corresponding site event to fetch the automatically generated packet capture.
- D. Verify the impacted site and use the corresponding organization event to fetch the automatically generated packet capture.

Answer: B

Explanation:

In Juniper Networks Mist AI Wireless, dynamic packet capture (dPCAP) is tightly integrated with events to enable rapid, context-aware troubleshooting. When Mist detects a systemic issue—such as a DHCP server becoming unresponsive—it automatically generates a site-level event because the problem impacts multiple devices within a site rather than a single client.

As shown in the exhibit, the event "DHCP is Unresponsive" lists multiple impacted devices and includes a timeline of contributing network events. This classification is critical: DHCP infrastructure failures are treated as site events, not client-specific or organization-wide events. When such a site event is triggered, Mist can automatically perform a dynamic packet capture on the relevant access points to capture DHCP Discover, Offer, Request, and Acknowledgment (DORA) traffic in real time.

To access this packet capture, an administrator must:

- * Navigate to the impacted site identified in the event.
- * Open the corresponding site event (in this case, the DHCP unresponsive event).
- * Download the automatically generated packet capture file, which can then be opened in Wireshark for detailed protocol-level analysis.

The incorrect options are explained as follows:

- * Organization events provide high-level visibility and auditing but do not host packet captures.
- * Client events are used when a single client experiences issues; they are not appropriate when multiple devices are impacted by a shared service failure.
- * Verifying an impacted client does not expose the dynamic packet capture tied to a site-wide DHCP issue.

Therefore, the correct method is to verify the impacted site and use the corresponding site event to fetch the automatically generated packet capture, making Option B the correct answer.
