ISC CISSP (Certified Information Systems Security Professional) Certification Exam is a globally recognized certification that validates the knowledge and expertise of information security professionals. Certified Information Systems Security Professional (CISSP) certification is designed to test the skills required to design, implement, manage, and maintain a secure business environment. CISSP Exam is based on a comprehensive Common Body of Knowledge (CBK) that covers various domains related to information security, including security and risk management, asset security, security engineering, communication and network security, identity and access management, security assessment and testing, security operations, and software development security.

ISC Certified Information Systems Security Professional (CISSP) Sample Questions (Q133-Q138):

NEW QUESTION # 133
Refer to the information below to answer the question.
An organization has hired an information security officer to lead their security department.
The officer has adequate people resources but is lacking the other necessary components to have an effective security program.
There are numerous initiatives requiring security involvement.
The effectiveness of the security program can PRIMARILY be measured through

- A. audit requirements.

- A. Hardening the system.
- B. Violating the security policy.
- C. Strengthening the security policy.
- D. Protecting the DMZ.

Answer: B

Explanation:
Covert channel is a communication channel that allows transfer of information in a manner that violates the system's security policy.

NEW QUESTION # 135
Which of the following refers to the data left on the media after the media has been erased?

- A. remanence
- B. recovery
- C. sticky bits
- D. semi-hidden

Answer: A

Explanation:
Actually the term "remanence" comes from electromagnetism, the study of the electromagnetics. Originally referred to (and still does in that field of study) the magnetic flux that remains in a magnetic circuit after an applied magnetomotive force has been removed. Absolutely no way a candidate will see anywhere near that much detail on any similar CISSP question, but having read this, a candidate won't be likely to forget it either.
It is becoming increasingly commonplace for people to buy used computer equipment, such as a hard drive, or router, and find information on the device left there by the previous owner; information they thought had been deleted. This is a classic example of data remanence: the remains of partial or even the entire data set of digital information. Normally, this refers to the data that remain on media after they are written over or degaussed. Data remanence is most common in storage systems but can also occur in memory.
Specialized hardware devices known as degaussers can be used to erase data saved to magnetic media. The measure of the amount of energy needed to reduce the magnetic field on the media to zero is known as coercivity.
It is important to make sure that the coercivity of the degausser is of sufficient strength to meet object reuse requirements when erasing data. If a degausser is used with insufficient coercivity, then a remanence of the data will exist. Remanence is the measure of the existing magnetic field

on the media; it is the residue that remains after an object is degaussed or written over.
Data is still recoverable even when the remanence is small. While data remanence exists, there is
no assurance of safe object reuse.

NEW QUESTION # 136
Controls are implemented to:

- A. mitigate risk and eliminate the potential for loss
- B. eliminate risk and eliminate the potential for loss
- C. mitigate risk and reduce the potential for loss
- D. eliminate risk and reduce the potential for loss

Answer: C

Explanation:
Controls are implemented to mitigate risk and reduce the potential for loss. Preventive controls are put in place to inhibit harmful occurrences; detective controls are established to discover harmful occurrences; corrective controls are used to restore systems that are victims of harmful attacks. It is not feasible and possible to eliminate all risks and the potential for loss as risk/threats are constantly changing.
