CompTIA CV0-004 Helpful Product Features of PDF

PassLeaderVCE is a reliable site offering the CV0-004 valid study material supported by 100% pass rate and full money back guarantee. Besides, our CV0-004 training material is with the high quality and can simulate the actual test environment, which make you feel in the real test situation. You can get the latest information about the CV0-004 real test, because our PassLeaderVCE will give you one year free update. You can be confident to face any difficulties in the CV0-004 actual test no matter any changes.

CompTIA Cloud+ (2025) Sample Questions (Q207-Q212):

NEW QUESTION # 207
A project manager is taking notes along with gathering feedback about a prior project in order to consider known issues with a project enhancement. Which of the following best describes the plan that the project team is working on?

- A. A plan for documenting the outcomes of the project
- B. A plan for avoiding potential issues that may arise during project execution
- C. A plan for capturing issues and conflicts in a project's knowledge base
- D. A plan for addressing and resolving identified issues once the project has been completed

Answer: B

Explanation:
The team is leveraging lessons learned to create a preventive plan for avoiding issues in the upcoming project enhancement. This falls

under risk management and compliance, ensuring previous failures do not repeat.

NEW QUESTION # 208

The performance of an e-commerce website decreases dramatically during random periods. The IT team is evaluating available resources to mitigate the situation. Which of the following is the best approach to effectively manage this scenario'?

- A. Migrating to a dedicated host
- B. Scheduling resource allocation
- C. Purchasing additional servers
- D. Configuring automatic elasticity

Answer: D

Explanation:

Configuring automatic elasticity is the best approach to manage an e-commerce website that experiences random performance drops due to variable traffic. Automatic elasticity enables the cloud resources to scale up or down automatically based on the current load, ensuring consistent performance even during unexpected traffic surges.

NEW QUESTION # 209

An administrator configures three subnets to the corporate network. All servers should communicate with the main corporate network and access the internet. The administrator creates the following configurations:

After configuring the networks, the administrator recognizes an issue with the configuration. Which of the following can the administrator change in one step to accomplish the goal?

- A. Add source 192.168.12.0/24 and destination 192.168.0.0/24 to the routing table.
- B. Reconfigure Network 4 to 192.168.13.0/24.
- C. Remove source 192.168.12.0/24 and destination 192.168.1.0/24 from the routing table.
- D. Replace destination 192.168.1.0/24 with destination 192.168.0.0/24.

Answer: D

Explanation:
* A. Remove 192.168.12.0/24 and 192.168.1.0/24: This would cause connectivity issues for Network 4.
* B. Replace 192.168.1.0/24 with 192.168.0.0/24: Corrects the incorrect destination for Network 4, aligning it with the corporate network subnet.
* C. Add 192.168.12.0/24 and 192.168.0.0/24: Duplicates an existing configuration and doesn't solve the issue.
* D. Reconfigure Network 4 to 192.168.13.0/24: Alters the network unnecessarily and doesn't resolve the destination routing issue.
Reference:CompTIA Cloud+ CV0-004 Study Guide, Objective 2.2: Configure routing tables to ensure proper network communication.

NEW QUESTION # 210

A company experienced a data leak through its website. A security engineer, who is investigating the issue, runs a vulnerability scan against the website and receives the following output:

Which of the following is the most likely cause of this leak?

- A. Insecure protocol
- B. Privilege escalation
- C. SQL injection
- D. RTMP port open

Answer: A

Explanation:
The data leak is most likely caused by the use of an insecure protocol. The vulnerability scan output shows that port 21/tcp for FTP (File Transfer Protocol) is open. FTP is known for transmitting data unencrypted, which could allow sensitive data to be intercepted during transfer.

NEW QUESTION # 211

The company's IDS has reported an anomaly. The cloud engineer remotely accesses the cloud instance, runs a command, and receives the following information:

Which of the following is the most likely root cause of this anomaly?

- A. Privilege escalation
- B. Leaked credentials
- C. Cryptojacking
- D. Defaced website

Answer: A

Explanation:
The output from the 'ps' command indicates there is a process running under the UID (User ID) of 0, which is the root user, and the command that was run is '/var/www/command.py'. Given that the normal Apache processes are running under their own UID (65535), this suggests that a command was executed with root privileges that typically should not have such high-level access. This is a strong indicator of privilege escalation, where an unauthorized user or process gains elevated access to resources that are normally protected from an application or user.
