Latest Arch-303 Exam Discount & Reliable Arch-303 Exam Simulator

It is our biggest goal to try to get every candidate through the exam. Although the passing rate of our Arch-303 simulating exam is nearly 100%, we can refund money in full if you are still worried that you may not pass the Arch-303 exam. You don't need to worry about the complexity of the refund process at all, we've made it quite simple. And if you really want to pass the exam instead of refund, you can wait for our updates for we will update our Arch-303 Study Guide for sure to make you pass the exam.

Salesforce Certified B2C Commerce Architect Sample Questions (Q51-Q56):

NEW QUESTION # 51
A Client has automated builds that deploy the code; however, recent builds started failing with compilation issues, which are not reproducible in developer's environment.
Whetfirst step needs to be taken to identify and fix the issue?

- A. Recreate the job in the build server to verify compilation issues.
- B. Verify the modules versions used to generate the code.
- C. Clean up build server work space and run job again.
- D. Verify the generated JavaScript and CSS for the build.

Answer: C

Explanation:
When facing build failures that are not reproducible in developers' environments, a common and effective first step is to clean up the build server workspace (Answer A). This action clears any residual files, settings, or data that might be influencing the build process and causing discrepancies between local and server builds. By resetting the workspace to a clean state, it helps ensure that the build process is starting from a consistent base, potentially resolving issues caused by stale data or corrupted build artifacts. This step often resolves hidden configuration or environment-specific issues that are not immediately apparent in the code or module versions.

NEW QUESTION # 52

The Architect has been presented with a requirement from the business to implement a new LINK cartridge.
The current site is built on the Storefront Reference Architecture, and the LINK cartridge is certified for Pipelines and Controllers.
On review, the Architect notes that the Jobs are all created in Pipelines.
How should the Architect implement that cartridge to make sure the required jobs runs property?

- A. The Job Pipelines must be updated to use SiteGenesis Controllers.
- B. The job Pipelines must be removed and recreated with scripts.
- C. The job Pipelines must be updated to work as custom job steps.
- D. The job Pipelines must be updated to useSFRA Controllers.

Answer: C

Explanation:
For integrating a LINK cartridge that is certified for pipelines and controllers into a system using the Storefront Reference Architecture (SFRA), which primarily uses scripts instead of the older pipeline technology, the architect should update the job pipelines to work as custom job steps. This approach allows the existing LINK cartridge functionalities to be maintained while making them compatible with the SFRA framework. Custom job steps enable more flexibility and the ability to leverage the full capabilities of SFRA, ensuring that the jobs run correctly within the newer architecture.

NEW QUESTION # 53

The Client wants to have a flashsate on a few products every day. These products are sold through B2C Commerce as well as an in store Point of Sale system that it tied to the same inventory.
An Architect analyzes the following proposed solution:
Inventory feed w*l continue to run dailybut add a web-service call to compare and update B2C Commerce inventory in real time during checkout after a flash product's inventory reaches a threshold.
Which two risks should the Architect communicate to the Client about this solution?
Choose 2 answers

- A. Because the job would still be configured to run daily there will be a degrade in performance during non-flash sales periods
- B. The default rate limiter configuration for the web-service could cause the web-service to return an exception during high traffic.
- C. If the product Inventory threshold that triggers the web service calls is reached too often. It will have a negative Impact on site performance.
- D. If the externals hosted web-service is unreliable. It could be a point of failure in the site s order placement flow.

Answer: B,D

Explanation:
The risks associated with the proposed real-time inventory update solution during flash sales are:
* Option A (The default rate limiter configuration for the web-service could cause the web-service to return an exception during high traffic): This is a critical risk because high traffic during flash sales could exceed the rate limits set for the web-service, leading to exceptions and potentially failing to update inventory in real-time.
* Option B (If the external hosted web-service is unreliable, it could be a point of failure in the site' s order placement flow): Reliance on an external web-service for crucial operations like inventory updates introduces a risk of downtime or performance issues if the service is unreliable, directly impacting the ability to complete orders during peak sales periods.
Both risks could severely disrupt operations during critical sales events, suggesting a need for robust contingency plans and potentially reevaluating the solution architecture to ensure reliability.

NEW QUESTION # 54

Northern Trail Outfitters uses an Order Management system (OMS), which creates an order tracking number for every order 24 hours after receiving it. The OMS provides only a web-service interface to get this tracking number. There is a job that updates this tracking number for exported orders, which were last modified yesterday.

Part of this jobs code looks like the following:

Based on the above description and code snippet, which coding best practice should the Architect enforce?

- A. Post-processing of search results is a bad practice that needs to be corrected.
- B. The transaction for updating of orders needs to be rewritten to avoid problems with transaction size.
- C. Standard order import should be used instead of modifying multiple order objects with custom code.
- D. Configure circuit breaker and timeout for the OMS web service call to prevent thread exhaustion.

Answer: D

Explanation:
Given that the OMS provides a web-service interface and updates tracking numbers for orders modified the previous day, it is crucial to manage the potential risks of service unavailability or delays that could lead to thread exhaustion in Salesforce Commerce Cloud. Implementing a circuit breaker pattern helps to manage failures gracefully by halting the interaction with the OMS if it becomes unresponsive, thereby preventing the service from impacting the entire system. Additionally, configuring timeouts ensures that the service calls do not hold up resources indefinitely. These strategies help maintain system stability and responsiveness, particularly when dealing with external systems over which there may be limited control.

NEW QUESTION # 55

During a load test the storefront shows steady but slow performance on all the paces being tested. The Architect opens Pipeline Profiler and sorts the data by *total time" column. The following come as the top Ave items:

Which controller should the Architect focus on to further investigate the performance issue?

- A. Home-IncludeHeaderMenu as It has highest average time.
- B. Search Show as this Is one of the key controllers that the customer uses
- C. Product-HitTile as it has the highest hits during the load test.
- D. Product-Detail as It has the highest total time and highest maximum time.

Answer: D

Explanation:
Focusing on the 'Product-Detail' controller is prudent given that it has the highest total time and the highest maximum time (Answer C), suggesting that it significantly contributes to the overall load and potential slowdowns on the site. By analyzing and optimizing this controller, the architect can potentially achieve the most substantial improvement in performance. Efforts might include optimizing database queries, caching frequently requested data, or simplifying complex logic in the Product-Detail page's processing.
