

# Latest DAA-C01 Version & DAA-C01 Exam Certification

BONUS!!! Download part of Real4exams DAA-C01 dumps for free: <https://drive.google.com/open?id=1pCYbmdQVRWiDpik3rjJ7d5GHskNkyl55>

In order to make the DAA-C01 exam easier for every candidate, Real4exams compiled such a wonderful DAA-C01 study materials that allows making you test and review history performance, and then you can find your obstacles and overcome them. In addition, once you have used this type of DAA-C01 Exam Question online for one time, next time you can practice in an offline environment. It must be highest efficiently exam tool to help you pass the DAA-C01 exam.

If you don't have enough time to study for your Snowflake SnowPro Advanced: Data Analyst Certification Exam exam, Real4exams provides Snowflake DAA-C01 Pdf questions. You may quickly download Snowflake DAA-C01 exam questions in PDF format on your smartphone, tablet, or desktop. You can Print Snowflake DAA-C01 pdf questions and answers on paper and make them portable so you can study on your own time and carry them wherever you go. Snowflake evolves swiftly, and a practice test may become obsolete within weeks of its publication. We provide free updates for Snowflake DAA-C01 Exam Questions for three months after the purchase to ensure you are studying the most recent Snowflake solutions.

>> Latest DAA-C01 Version <<

## DAA-C01 Exam Certification, Test DAA-C01 Sample Online

Our website is equipped with a team of IT elites who devote themselves to design the Snowflake exam dumps and top questions to help more people to pass the certification exam. They check the updating of exam dumps everyday to make sure DAA-C01 Dumps latest. And you will find our valid questions and answers cover the most part of DAA-C01 real exam.

## Snowflake SnowPro Advanced: Data Analyst Certification Exam Sample Questions (Q44-Q49):

### NEW QUESTION # 44

You have a Snowflake table named 'sensor\_data' with a column 'reading' containing JSON data'. The JSON structure varies, but you want to extract a specific nested value, 'temperature', using a UDF. The path to 'temperature' might be different depending on the 'sensor\_type'. Some sensors have the temperature at '\$.metrics.temperature', others at '\$.reading.temp\_c'. The sensor type is stored in the 'sensor\_type' column. You want to create a UDF named which takes the JSON 'reading' and the 'sensor\_type' as input and extracts the temperature, returning NULL if the path does not exist in the JSON. How can you implement this using a JavaScript UDF and Snowflake's JSON parsing functions for optimal performance?

- A. Option B
- B. Option D
- C. Option C
- D. Option E
- E. Option A

Answer: C

Explanation:

Option C is the MOST optimal. It uses 'VARIANT' as the input data type for 'reading', which avoids the unnecessary parsing of JSON using as Snowflake automatically parses JSON data into a VARIANT type. It also includes a 'try...catch' block to handle cases where the specified path does not exist within the JSON, returning 'NULL' as required. This prevents errors from halting the query. Using 'VARIANT' directly and exception handling offers superior performance. Option A and D parse VARIANT as String, leading to parsing overhead. B misses the try catch block and is prone to failure when temp is not available for a given sensor. Option E is less efficient than option C due to using array notation.

#### NEW QUESTION # 45

When considering row access policies and Dynamic Data Masking in Snowflake, how do they influence data visibility and security?

- A. Grant unrestricted access to all data
- B. Limit data access based on user roles
- C. Only apply to certain data types
- D. Dynamically mask sensitive data for specific users

Answer: B,D

Explanation:

Row access policies and Dynamic Data Masking play vital roles in limiting data access based on user roles and dynamically masking sensitive data to enhance data security and visibility for authorized users.

#### NEW QUESTION # 46

A Data Analyst created a cost overview dashboard in Snowsight. Management has asked for a system date filter to easily change the time period and refresh the data in all dashboard tiles with a single filter selection.

The system date filter is shown below:

The Analyst wants to apply the filter onto individual dashboard components.

Adding which where clause to the queries will apply the filter as required?

- A. Where start\_time >= dateadd('days', -7, SYSDATE())
- B. Where start\_time = :date\_filter
- C. Where start\_time >= dateadd('days', -7, CURRENT\_TIMESTAMP())
- D. Where start\_time = :daterange

Answer: D

Explanation:

In Snowsight, the modern web interface for Snowflake, System Filters are specialized keywords that provide out-of-the-box interactivity for dashboards and worksheets. These filters allow non-technical users to manipulate the timeframes of visualizations (e.g., switching from "Last 7 days" to "Last 12 months") without requiring an analyst to manually rewrite the underlying SQL code. The most critical keyword for temporal filtering is :daterange. When a dashboard contains a date filter widget (as shown in the provided exhibit), the :daterange keyword acts as a dynamic placeholder for the range selected by the user. Unlike a standard variable that might represent a single date, :daterange is specifically designed to handle the start and end boundaries of a period. When injected into a WHERE clause, Snowflake automatically expands this keyword into the appropriate logic to filter records between those two points in time.

Evaluating the Options:

\* Options A and B are incorrect because they use hard-coded logic (-7 days). While these would return data for the last week, they are static. Changing the filter in the dashboard UI would have no effect on these queries, failing the requirement to "easily change the time period" via the filter selection.

\* Option C is incorrect because :date\_filter is not a reserved system keyword in Snowsight. While an analyst could create a custom filter with that name, it would not automatically link to the standard system date widget shown in the image.

\* Option D is the 100% correct answer. Using WHERE <column> = :daterange is the documented standard for linking a query to the Snowsight system date filter. This ensures that every tile in the dashboard remains synchronized with the user's global date selection, providing a cohesive and interactive reporting experience.

#### NEW QUESTION # 47

You have a Snowflake table called 'CUSTOMER ORDERS that stores customer order data'. The business requires you to generate

a weekly report on the top 10 customers by order value, delivered as an Excel file to a shared network drive. The network drive is accessible by a service account that your Snowflake account can authenticate against. The report must include customer name, total order value, and number of orders. Which approach is the MOST secure and efficient for automating this process?

- **A. Leverage a Snowflake Task to run a stored procedure. The procedure queries the data, transforms it into CSV format using Snowflake scripting. Then uses a Java UDF to copy the CSV to an internal stage, from where a separate process (outside Snowflake) monitors for new files and transfers them to the network drive using the service account. Securely manage credentials for both the Java UDF and the external process.**
- B. Create a Snowflake external function using AWS API Gateway and AWS Lambda. The external function queries the data from Snowflake, formats it as an Excel file using a Python library (e.g., openpyxl) within the Lambda function, and saves the file directly to the network drive using the service account's credentials. Configure API Gateway to authenticate requests from Snowflake.
- C. Create a view on top of the CUSTOMER\_ORDERS table that calculates the required metrics. Use a third-party ETL tool to extract the data from the view, format it as an Excel file, and save it to the network drive. Configure the ETL tool with appropriate Snowflake credentials.
- D. Use a Snowflake Task to trigger a Snowpipe. A Snowflake stored procedure that executes SQL code to query for relevant data, convert it to JSON, then the Snowpipe load into the network directory using REST API. Grant necessary permissions to the task's service account.
- E. Create a Snowflake Task that executes a stored procedure. The stored procedure uses a Snowflake Scripting block to query the data, format the data using Javascript UDF to XML, write the Excel file to an internal stage using Java UDF, and then use a Python UDF to copy the file to the network drive. Grant necessary permissions to the task's service account.

**Answer: A**

Explanation:

Option E provides a balance of security and efficiency. By creating a task that runs a stored procedure, converting data to CSV and using Java UDF to copy to an internal stage. A external process which is also monitoring the file and move to network directory using service account. It encapsulates logic within Snowflake and minimizes external dependencies. This approach avoids directly exposing Snowflake credentials to a third-party ETL tool or directly accessing the network drive from within Snowflake, which are security concerns. Option A involves writing directly to the network drive from within Snowflake, which may be complex to set up securely. Option B is generally not recommended due to external function overhead. Option C Introduces external dependency and Snowflake credentials needs to be managed carefully for the third party ETL tool. Option D is not possible since Snowpipe doesn't have capability to load into the network directory directly.

#### NEW QUESTION # 48

You are working with a Snowflake table called containing sales transactions. The table includes columns like 'transaction\_id' (VARCHAR), 'product\_id' (VARCHAR), 'transaction\_date' (DATE), (NUMBER(10,2)), and (GEOGRAPHY). You need to perform the following data preparation tasks: 1. Clean the data: Remove transactions with less than or equal to 0. 2. Transform the data: Convert the 'customer\_location' from GEOGRAPHY to a WKT string representation. 3. Enrich the data: Calculate the year and month from the 'transaction\_date' and add them as new columns. 4. Mask the data: Partially mask the 'transaction\_id' column to protect customer data by only displaying the last 4 digits of the ID. Considering performance and best practices, what is the MOST efficient way to achieve these transformations using Snowflake features? You need to achieve this in a single statement.

- **A.**
- B.
- C.
- **D.**
- E.

**Answer: A,D**

Explanation:

Options A and D are functionally equivalent and correct, they both performs the desired data cleansing, transformation, and enrichment in a single 'CREATE OR REPLACE TABLE' statement. The 'WHERE sales\_amount > 0' clause filters out invalid transactions. RIGHT(transaction\_id, 4) masks the transaction ID. YEAR() and MONTH() extract the year and month from the date, and ST\_ASTEXT() converts the GEOGRAPHY object to a WKT string. Option B uses HASH, but the question asks for partially masking so HASH isn't suitable. Option C uses CASE, that is not required. Option E makes use of SYSTEM\$MASK, function which masks the entire column value, that isn't what the questions asks.

## NEW QUESTION # 49

.....

Our DAA-C01 study guide has PDF, Software/PC, and App/Online three modes. You can use scattered time to learn whether you are at home, in the company, or on the road. At the same time, the contents of DAA-C01 learning test are carefully compiled by the experts according to the content of the examination syllabus of the calendar year. With our DAA-C01 Study Materials, you only need to spend 20 to 30 hours to practice before you take the DAA-C01 test, and have a high pass rate of 98% to 100%.

**DAA-C01 Exam Certification:** [https://www.real4exams.com/DAA-C01\\_braindumps.html](https://www.real4exams.com/DAA-C01_braindumps.html)

Following us, find out the secrets how you can pass your exam or test with our DAA-C01 PDF & test engine dumps and become specialized experts in this area, You can not only master all the questions and answers of the valid dumps files but also imagine you were attending the real test and practice DAA-C01 vce exam many times as you want, Besides, they are easy to assimilate so if you get stuck in the bottleneck of review, and under the guidance of our DAA-C01 Exam Certification - SnowPro Advanced: Data Analyst Certification Exam exam question they are widely regarded as top notch in this area.

The other configuration is accomplished by invoking DAA-C01 one of the job's setter methods, The system will automatically deduct the corresponding money, Following us, find out the secrets how you can pass your exam or test with our DAA-C01 PDF & test engine dumps and become specialized experts in this area.

## Purchase Snowflake DAA-C01 Exam Questions Today for Hassle-Free Preparation

You can not only master all the questions and answers of the valid dumps files but also imagine you were attending the real test and practice DAA-C01 vce exam many times as you want.

Besides, they are easy to assimilate so if you get stuck in the bottleneck DAA-C01 Exam Certification of review, and under the guidance of our SnowPro Advanced: Data Analyst Certification Exam exam question they are widely regarded as top notch in this area.

You will need to pass the SnowPro Advanced: Data Analyst Certification Exam (DAA-C01) exam to achieve the SnowPro Advanced: Data Analyst Certification Exam (DAA-C01) certification, High quality DAA-C01 dumps pdf training resources and study guides free download from Real4exams, 100% success and guarantee to pass DAA-C01 dumps exam test easily at first attempt.
