LookupTableGet (MalwareIPList : Source IP : Confidence) >= 87

Apply & Run Apply Cancel

Consider a custom lookup table MalwareIPList. An analyst constructed an analytic query to reference the MalwareIPList lookup table.

What is the outcome of the analytic query?

- A. The permitted traffic IP address from the Phishing category is displayed.
- B. The IP address from permitted traffic with a confidence score of 98 is displayed.

- C. The analyst receives an error because the LookupTableGet function can be used only in display filters to enrich data.
- D. The value for the LookupTableGet function in the analytic search can be either true or false.

Answer: C

Explanation:

The LookupTableGet function is designed to enrich event data by referencing a lookup table. However, it cannot be used directly in analytic queries for filtering data before processing. Instead, it is meant to be applied as a display filter to enhance results after retrieval.

In the given query, LookupTableGet(MalwareIPList : Source IP : Confidence) >= 87 is being used in a filter condition, which leads to an error because the function is not valid in this context. It should be applied after the data is retrieved, not as a pre-processing filter.

NEW QUESTION # 59

Which three statements about phRuleMaster are true? (Choose three.)

- A. phRuleMaster is present on the supervisor and workers.
- B. phRuleMaster wakes up to evaluate all the rule data in parallel, every 30 seconds.
- C. phRuleMaster queues up the data being received from the phRuleWorkers into buckets.
- D. phRuleMaster wakes up to evaluate all the rule data in series, every 30 seconds.
- E. phRuleMaster is present on the supervisor only.

Answer: A,B,C

Explanation:

phRuleMaster runs on both the supervisor and worker nodes, allowing distributed event processing. It receives filtered data from phRuleWorkers and organizes it into buckets before evaluation. Every 30 seconds, it processes the rule data in parallel, ensuring efficient rule execution. The incorrect options suggest that phRuleMaster runs only on the supervisor or evaluates rules sequentially, both of which are inaccurate.
