CompTIA Cloud Essentials+ Certification Exam Sample Questions (Q50-Q55):

NEW QUESTION # 50
Which of the following refers to providing a combination of servers, networking components, hosting, provisioning, and basic services needed to run a cloud?

- A. CaaS

- B. PaaS
- C. IaaS
- D. SaaS

Answer: C

NEW QUESTION # 51
In an IaaS cloud environment, which of the following outlines the duties of the CSP and cloud consumer?

- A. Statement of work
- B. Shared responsibility
- C. Self-service
- D. Standard operating procedures
- E. Hybrid model

Answer: B

Explanation:
In an IaaS (Infrastructure as a Service) cloud environment, the shared responsibility model outlines the division of duties between the Cloud Service Provider (CSP) and the cloud consumer. The CSP typically manages the underlying infrastructure, including the physical hardware, networking, and virtualization layer, while the cloud consumer is responsible for managing the operating system, applications, and data. This model helps define the specific roles and security responsibilities for both parties.

NEW QUESTION # 52
Why do business users prefer to deal with cloud providers directly, instead of via the IT department?

- A. It reduces financial risks to the business
- B. They can better measure the provider's quality
- C. They can use their own payment options
- D. The IT department does not accommodate variable costs

Answer: D

NEW QUESTION # 53
Which of the following can be used to achieve automation, environment consistency, and standardization of computer resources in a cloud environment?

- A. Infrastructure as code
- B. Service-oriented architecture
- C. Content management system
- D. Automation

Answer: A

Explanation:
Infrastructure as code (IaC) is the ability to provision and support your computing infrastructure using code instead of manual processes and settings1. IaC can be used to achieve automation, environment consistency, and standardization of computer resources in a cloud environment, as it eliminates the need for developers to manually configure and manage servers, operating systems, database connections, storage, and other infrastructure elements every time they want to develop, test, or deploy a software application2. IaC also enables developers to easily duplicate, track, and version their infrastructure, and to avoid configuration errors and drifts that can cause deployment failures2. IaC is an essential DevOps practice, as it enables faster and more reliable software delivery lifecycles2. NEW QUESTION # 54
A cloud administrator needs to enable users to access business applications remotely while ensuring these applications are only

installed on company-controlled equipment. All users require the ability to modify personal working environments. Which of the following is the BEST solution?

- A. SSH
- B. VPN
- C. VDI
- D. SSO

Answer: C

Explanation:
The best solution for this scenario is Virtual Desktop Infrastructure (VDI). VDI is a cloud service model that provides users with virtual desktops that run on a centralized server. Users can access their virtual desktops remotely from any device, such as a laptop, tablet, or smartphone, using a thin client or a web browser. VDI enables users to access business applications without installing them on their own devices, which ensures that these applications are only installed on company-controlled equipment. VDI also allows users to modify their personal working environments, such as desktop settings, wallpapers, or preferences, which are saved on the server and persist across sessions. VDI can offer benefits such as improved security, reduced hardware costs, centralized management, and enhanced user experience. The other options are not the best solutions for this scenario. Single Sign-On (SSO) is a cloud service that enables users to log in to multiple applications or systems with one set of credentials, which simplifies authentication and improves security. However, SSO does not provide users with remote access to business applications or personal working environments. Secure Shell (SSH) is a network protocol that allows secure remote access to a server or a device using encryption and authentication. SSH can be used to execute commands, transfer files, or tunnel network traffic. However, SSH does not provide users with virtual desktops or business applications. Virtual Private Network (VPN) is a network technology that creates a secure connection between a remote device and a private network over a public network, such as the Internet. VPN can be used to access network resources, such as files, printers, or applications, that are not available otherwise. However, VPN does not provide users with virtual desktops or personal working environments.
