## Test AD0-E724 Simulator Online | AD0-E724 Pass Test

The sources and content of our AD0-E724 practice materials are all based on the real exam. And they are the masterpieces of professional expertise these area with reasonable prices. Besides, they are high efficient for passing rate is between 98 to 100 percent, so they can help you save time and cut down additional time to focus on the AD0-E724 Actual Exam review only. We understand your drive of the AD0-E724 certificate, so you have a focus already and that is a good start.

## Adobe Commerce Developer Professional Sample Questions (Q104-Q109):

### NEW QUESTION # 104

A merchant of an Adobe Commerce Cloud project wants to setup one of their websites using a subdomain.

The merchant is considering the domain to be set as `secondstore.example.com`.

In addition to editing the `magento-vars.php` file, and apply a domain check and set `$_SERVER["MAGE_RUN_CODE"]` and `$_SERVER["MAGE_RUN_TYPE"]`.

What file is required to perform this action?

- A. Configure secondstore.example.com subdomain route in .magento/services.yaml.
- B. Configure secondstore.example.com subdomain route in NGINX virtual-host configuration file.
- C. Configure secondstore.example.com subdomain route in .magento/routes.yaml.

**Answer: C**

Explanation:

In Adobe Commerce Cloud, routing configurations for custom domains and subdomains are managed within the .magento/routes.yaml file. This file defines how requests are directed to the application and is essential for setting up different stores or websites with unique subdomains.

\* Using .magento/routes.yaml for Subdomain Configuration:

\* To set up a new subdomain, like secondstore.example.com, you need to configure the route in .magento/routes.yaml. This file handles all routing and domain configurations for Adobe Commerce Cloud projects.

\* Why Option C is Correct:

\* .magento/routes.yaml is designed specifically for defining routing rules, including subdomains, making it the appropriate choice for this task.

\* Option A (NGINX configuration) and Option B (.magento/services.yaml) are not correct because they don't directly manage domain routing in Adobe Commerce Cloud.

\* Example Configuration:

http://secondstore.example.com/:

type: upstream

upstream: "mymagento:80"

## NEW QUESTION # 105

Which two methods add sorting to collections inherited from the \Magento\Framework\Model\ResourceModel\Db\Collection\AbstractCollection class? (Choose two.)

- A. addOrder
- B. setOrder
- C. setSorting
- D. addSorting

**Answer: A,B**

Explanation:

The two methods that add sorting to collections inherited from the \Magento\Framework\Model\ResourceModel\Db\Collection\AbstractCollection class are setOrder and addOrder. These methods allow adding one or more order clauses to a collection query.

The setSorting and addSorting methods do not exist in Adobe Commerce.

Verified References: [Adobe Commerce Developer Guide - Collections]

In Magento 2, collections inherited from

\Magento\Framework\Model\ResourceModel\Db\Collection\AbstractCollection class can be sorted using the setOrder and addOrder methods. The setOrder method is used to set the order for a field in the collection, specifying the field by which to sort and the direction of the sorting (ASC or DESC). The addOrder method is similar but allows for adding multiple sorting orders to the collection, enabling more complex sorting scenarios. There are no setSorting or addSorting methods in the standard Magento 2 collection classes.

## NEW QUESTION # 106

An Adobe Commerce Developer wishes to add an action to a pre-existing route, but does not wish to interfere with the functionality of the actions from the original route.

What must the developer do to ensure that their action works without any side effects in the original module?

- A. Add the action into to the controllers/front\_name/ in My.Module, Magento will automatically detect and use it.
- B. In the route declaration, use the before or after parameters to load their module in before or after the original module.
- C. Inject the new action into the standard router constructor's \$actionist parameter.

**Answer: A**

Explanation:

In Magento 2, to add a new action to a pre-existing route without interfering with the existing functionality, the new action should be placed in the same directory structure under the new module's controller namespace.

Magento's autoloading mechanism will automatically detect and include it alongside the original module's actions.

Here's how you can achieve this:

- \* Directory Structure: Ensure that your new module's controller directory structure mirrors that of the original module.

- \* Controller Action: Define the new action within the appropriate directory.

For example, if you want to add a new action to the catalog route in `Magento_Catalog`:

- \* Create a directory structure `app/code/My/Module/Controller/Catalog/`.

- \* Add your new action class in this directory, for example:

```
namespace My\Module\Controller\Catalog;
use Magento\Framework\App\Action\Action;
use Magento\Framework\App\Action\Context;
class NewAction extends Action
{
    public function __construct(Context $context)
    {
        parent::__construct($context);
    }
    public function execute()
    {
        // Your custom logic here
    }
}
```

Router Configuration: Magento automatically includes this action when the route matches.

By following this method, you ensure that your new action is added seamlessly without modifying the original module or causing conflicts. Magento's router will include and recognize your action based on the directory and namespace conventions.

### NEW QUESTION # 107

On an Adobe Commerce Cloud platform, what type of environment will be provisioned when launching the CLI for Commerce command `magento-cloud environment:branch <environment-name> <parent-environment-id>`?

- A. An integration environment with the code and database from the parent environment.
- B. An integration environment with fresh Adobe Commerce Cloud installation.
- C. An empty integration environment without any code or database.

**Answer: A**

Explanation:

The type of environment that will be provisioned when launching the CLI for Commerce command `magento-cloud environment:branch <environment-name> <parent-environment-id>` is an integration environment with the code and database from the parent environment. Integration environments are temporary environments that are used for testing and development purposes on the Adobe Commerce Cloud platform. They can be created from any branch of code and have their own dedicated database and services. When creating an integration environment using the CLI for Commerce command, the code and database from the parent environment are copied to the new integration environment, creating an exact replica of the parent environment. Verified References: [Magento 2.4 DevDocs]

### NEW QUESTION # 108

An Adobe Commerce Cloud project is using Enhanced Integration Environments with two install a new payment module.

The developer is using Cloud CLI for Commerce tool.

What would a developer do to test this new feature under the integration environment?

- A. 1. Deactivate one of the active integration environment branches.  
2. Create a new active branch from integration and install the module.  
3. Push the changes.
- B. 1. Duplicate one of the integration environment branches.

2. Create a new active branch from integration and install the module.
3. Push the changes.
- C. 1. Create a new branch from integration and install the module.
2. Push the changes.
3. Branch active status check is not necessary.

**Answer: A**

Explanation:

The developer can test the new feature under the integration environment by deactivating one of the active integration environment branches, creating a new active branch from integration and installing the module, and pushing the changes. This is because Enhanced Integration Environments have a limit of four active branches at a time, and each branch has its own dedicated database and services. The developer can use the Cloud CLI for Commerce tool to manage the branches and deploy the code changes.

Verified References:

[Magento 2.4 DevDocs] 1

Enhanced Integration Environments in Adobe Commerce Cloud have a limit on the number of active branches. If both integration branches are currently active, one must be deactivated to create a new active branch for testing.

\* Creating a New Active Integration Branch:

\* If there are already two active branches, deactivate one to free up space for a new branch.

\* Then create a new branch from the integration environment, apply the changes (such as installing the new module), and push the changes.

\* Why Option C is Correct:

\* Adobe Commerce Cloud limits the number of active integration branches. Deactivating an existing branch is necessary before creating a new active branch for testing.

\* Option A suggests duplicating a branch without addressing the active branch limitation, while Option B disregards the need to check branch active status, which could prevent successful deployment.

## NEW QUESTION # 109

.....

DumpsKing online digital Commerce Developer Professional (AD0-E724) exam questions are the best way to prepare. Using our Commerce Developer Professional (AD0-E724) exam dumps, you will not have to worry about whatever topics you need to master. To practice for a Adobe AD0-E724 certification exam in the software (free test), you should perform a self-assessment. The Adobe AD0-E724 Practice Test software keeps track of each previous attempt and highlights the improvements with each attempt. The Commerce Developer Professional (AD0-E724) mock exam setup can be configured to a particular style or arrive at unique questions.
