CLF-C02資格トレーニング、CLF-C02予想試験

なぜ我々はあなたが購入した前にやってみることを許しますか。なぜ我々はあなたが利用してからAmazonのCLF-C02試験に失敗したら、全額で返金するのを承諾しますか。我々は弊社の商品があなたに試験に合格させるのを信じています。AmazonのCLF-C02試験が更新するとともに我々の作成するソフトは更新しています。

Amazon AWS Certified Cloud Practitioner 認定 CLF-C02 試験問題 (Q763-Q768):

質問 # 763

A company is building an application on AWS. The application needs to comply with credit card regulatory requirements. The company needs proof that the AWS services and deployment are in compliance.

Which actions should the company take to meet these requirements? (Select TWO.)

- **A. Get the compliance of the application certified by a company assessor.**
- B. Use AWS Security Hub to certify the compliance of the application.
- **C. Use AWS Artifact to access AWS documents about the compliance of the services.**
- D. Ensure that the application's underlying hardware components comply with requirements.
- E. Use Amazon Inspector to submit the application for certification.

正解: A、C

解説:

Explanation

Using AWS Artifact to access AWS documents about the compliance of the services, and getting the compliance of the application certified by a company assessor are actions that the company should take to meet the requirements of complying with credit card regulatory requirements. AWS Artifact is a service that provides on-demand access to AWS security and compliance reports and select online agreements. Reports available in AWS Artifact include our Service Organization Control (SOC) reports, Payment Card Industry (PCI) reports, and certifications from accreditation bodies across geographies and compliance verticals that validate the implementation and operating effectiveness of AWS security controls. AWS Artifact can help you demonstrate compliance with credit card regulatory requirements by providing you with proof that the AWS services and deployment are in compliance. Getting the compliance of the application certified by a company assessor is an action that the company should take to ensure that the application meets the specific requirements of the credit card industry. A company assessor is an independent third-party entity that is qualified to assess the compliance of the application with the relevant standards and regulations. Using Amazon Inspector to submit the application for certification is not an action that the company should take, because Amazon Inspector is a service that helps you improve the security and compliance of your applications deployed on AWS by automatically assessing them for vulnerabilities and deviations from best practices, but it does not provide certification for the applications. Ensuring that the application's underlying hardware components comply with requirements is not an action that the company should take, because the application is deployed on AWS, and AWS is responsible for the security and compliance of the underlying hardware components.

This is part of the shared responsibility model, where AWS is responsible for security of the cloud, and customers are responsible for security in the cloud. Using AWS Security Hub to certify the compliance of the application is not an action that the company should take, because AWS Security Hub is a service that gives you a comprehensive view of your security posture across your AWS accounts and helps you check your environment against security industry standards and best practices, but it does not provide certification for the applications.

質問 # 764

A company wants to quickly implement a continuous integration/continuous delivery (CI/CD) pipeline. Which AWS service will meet this requirement?

- A. Amazon Cognito
- **B. AWS CodeStar**
- C. AWS Config
- D. AWS DataSync

正解: B

解説:

Explanation

AWS CodeStar is a service that enables you to quickly develop, build, and deploy applications on AWS. It provides a unified user interface for managing your application lifecycle, including code repositories, build pipelines, deployments, and project dashboards. AWS CodeStar also integrates with other AWS services, such as AWS CodeCommit, AWS CodeBuild, AWS CodeDeploy, and AWS CodePipeline, to create a complete CI/CD pipeline for your application¹². 質問 # 765

Which of the following is an AWS value proposition that describes a user's ability to scale infrastructure based on demand?

- A. Global deployment
- B. Speed of innovation
- **C. Resource elasticity**
- D. Decoupled architecture

正解: C

解説:

Explanation

Resource elasticity is an AWS value proposition that describes a user's ability to scale infrastructure based on demand. Resource elasticity means that the user can provision or deprovision resources quickly and easily, without any upfront commitment or long-term contract. Resource elasticity can help the user optimize the cost and performance of the application, as well as respond to changing business needs and customer expectations.

Resource elasticity can be achieved by using services such as Amazon EC2, Amazon S3, Amazon RDS, Amazon DynamoDB, Amazon ECS, and AWS Lambda. [AWS Cloud Value Framework] AWS Certified Cloud Practitioner - aws.amazon.com

質問 # 766

A company wants to store data with high availability, encrypt the data at rest, and have direct access to the data over the internet. Which AWS service will meet these requirements MOST cost-effectively?

- **A. Amazon Elastic File System (Amazon EFS)**
- B. AWS Storage Gateway
- C. Amazon S3
- D. Amazon Elastic Block Store (AmazonEBS)

正解: A

解説:

Amazon Elastic File System (Amazon EFS) provides a simple, scalable, fully managed elastic NFS file system for use with AWS

Cloud services and on-premises resources. It is built to scale on demand to petabytes without disrupting applications, growing and shrinking automatically as you add and remove files, eliminating the need to provision and manage capacity to accommodate growth. Amazon EFS offers two storage classes: the Standard storage class, and the Infrequent Access storage class (EFS IA). EFS IA provides price/performance that is cost-optimized for files not accessed every day. Amazon EFS encrypts data at rest and in transit, and supports direct access over the internet⁴.

質問 # 767

A company is operating several factories where it builds products. The company needs the ability to process data, store data, and run applications with local system interdependencies that require low latency. Which AWS service should the company use to meet these requirements?

- A. AWS IoT Greengrass
- **B. AWS Outposts**
- C. AWS Lambda
- D. AWS Snowball Edge

正解: B

解説:

Explanation

AWS Outposts is a service that provides fully managed AWS infrastructure and services on premises. It allows users to run applications that require low latency and local data processing, while seamlessly connecting to the AWS Cloud for a consistent hybrid experience. AWS IoT Greengrass is a service that provides local compute, messaging, data caching, sync, and ML inference capabilities for connected devices. AWS Lambda is a service that allows users to run code without provisioning or managing servers. AWS Snowball Edge is a device that provides a petabyte-scale data transport and edge computing solution.
