Integration-Architect最新問題、Integration-Architect学習教材

私たちのIntegration-Architect研究ブレンダンプは、この点でユーザーの需要を満たすのに非常に優れている可能性があり、ユーザーが学習したことを継続的に統合する良い環境で読み書きできるようにします。Integration-Architect準備ガイドは高品質です。当社のウェブサイトのIntegration-Architect学習クイズバンクおよび教材は、選択したトピックに基づいて最新の質問と回答を検索します。この選択は、あなたのキャリア全体の突破口となるので、Integration-Architectスタディガイドの高い品質と正確性に驚かされるでしょう。

Salesforce Certified Integration Architect 認定 Integration-Architect 試験問題 (Q41-Q46):

質問 # 41

The Sales Operations team at Northern Trail Outfitters imports new leads each day. An integrated legacy territory management system assigns territories to leads before Sales team members can work on them. The current integration often experiences latency issues.

Which two recommendations should an Architect make to improve the integration performance?

Choose 2 answers

- A. Legacy system should submit in serial mode.
- **B. Reduce batch size of asynchronous BULK API.**
- C. Reduce batch size of synchronous BULK API.
- **D. Legacy system should submit in parallel mode.**

正解: B、D

質問 # 42

Which Web Services Description Language (WSDL) should an architect consider when creating an integration that might be used for more than one Salesforce org and different metadata?

- A. SOAP API WSDL
- B. Enterprise WSDL
- C. Partner WSDL

正解: C

解説:

In the world of Salesforce SOAP APIs, the choice of WSDL depends on the nature of the application being built. When an architect needs to build an integration that is org-agnostic—meaning it can work across multiple different Salesforce organizations with varying custom objects and fields—the Partner WSDL is the correct choice.

The Partner WSDL is loosely-typed. It does not contain information about an org's specific custom metadata; instead, it uses a generic sObject structure. This allows a single client application (like a third-party integration tool or a mobile app) to connect to any Salesforce org and dynamically discover its schema at runtime. Because it is not tied to a specific org's metadata, it does not need to be regenerated every time a custom field is added to one of the target orgs.

In contrast, Option A (Enterprise WSDL) is strongly-typed. It is generated specifically for one org and contains hard-coded references to that org's custom objects and fields. While this provides better compile-time safety for internal, single-org integrations, it is unsuitable for an application intended for "more than one Salesforce org" because the WSDL would be invalid for any org that doesn't have the exact same metadata.

Option C is a general term; the actual choices provided by Salesforce for integration are the Partner or Enterprise WSDLs. Therefore, for maximum flexibility and reusability across a multi-org landscape, the Partner WSDL is the industry standard.

質問 # 43

Northern Trail Outfitters is planning to perform nightly batch loads into Salesforce from an external system with a custom Java application using the and the CIO is curious about monitoring recommendations for the jobs from the Technical Architect Which two recommendations will help meet the requirements?

Choose 2 answers

- A. Use the `getBatchInfo` method in the Java application to monitor the status of the jobs from the Java application.
- B. Write the error response from the Bulk API status to a custom error logging object in Salesforce using an Apex trigger and create reports on the object.
- C. Visually monitor in the Salesforce UI using the "Bulk Data Load Jobs in Salesforce in the setup menu.
- D. Set the Salesforce debug logs level to "finest" and add the user Id running the job to monitor in the "Debug Logs" in the setup menu.

正解: A、C

解説:

Explanation

Visually monitor in the Salesforce UI using the "Bulk Data Load Jobs" in Salesforce in the setup menu, and use the `getBatchInfo` method in the Java application to monitor the status of the jobs from the Java application.

These two methods can help the Technical Architect to monitor the nightly batch loads into Salesforce from an external system with a custom Java application using the Bulk API. The "Bulk Data Load Jobs" page in Salesforce shows the status, progress, and results of each batch load job. The `getBatchInfo` method in the Java application returns a `BatchInfo` object that contains information about a batch, such as its ID, state, number of records processed, and number of errors. 質問 # 44

An Architect has received a request to prevent employees that leave the company from accessing data in Salesforce after they are deactivated in the company's HR system.

What should an Architect determine before recommending a solution?

- A. Determine data volume requirements, then identify the loading schedule.
- B. Determine data access prevention requirements, then identify system constraints.
- C. Determine inbound integration requirements, then identify frequency.
- D. Determine data access prevention requirements, then identify frequency.

正解: D

解説:

Explanation

The Architect should determine the data access prevention requirements and then identify the system constraints before recommending a solution. The data access prevention requirements are the business rules and policies that define how to prevent deactivated employees from accessing Salesforce data. For example, the Architect should determine whether the HR system can send a notification to Salesforce when an employee is deactivated, or whether Salesforce needs to query the HR system periodically to check the employee status.

The system constraints are the technical limitations and challenges that may affect the integration solution. For example, the Architect should determine whether the HR system supports outbound or inbound integration, what are the security and authentication protocols, what are the data formats and protocols, and what are the performance and scalability requirements. The frequency of the integration is not as important as the requirements and constraints, as it can be adjusted based on the business needs and technical feasibility. The data volume requirements and loading schedule are not relevant for this scenario, as they are more applicable for data migration or replication scenarios.

質問 # 45

Northern Trail Outfitters is planning to create a native employee-facing mobile app with the look and feel of Salesforce's Lightning Experience. The mobile app needs to integrate with their Salesforce org. Which Salesforce API should be used to implement this integration?

- A. Streaming API
- B. Connect REST API
- C. REST API
- D. User Interface API

正解: D

解説:

User Interface API should be used to implement this integration. User Interface API is a RESTful API that allows you to create native mobile apps and custom web apps with the look and feel of Salesforce's Lightning Experience. User Interface API provides access to metadata, data, and UI components, such as layouts, actions, picklists, and record types. User Interface API also handles security, performance, and compatibility across different devices and browsers.
