### CompTIA DataSys+ Certification Exam Sample Questions (Q137-Q142):

**NEW QUESTION # 137**

Which of the following are logical infrastructure security measures? (Choose two.)

- A. Firewall
- B. Port security
- C. Time locks
- D. Camera systems
- E. Key cards
- F. Strong passwords

**Answer: A,F**

Explanation:

Firewalls and strong passwords are logical security measures that protect digital infrastructure by controlling access and authentication.

**NEW QUESTION # 138**

Which of the following is a tool for preventing data loss?

- A. Scripts
- B. IP configuration
- C. Gateway
- D. Encryption

**Answer: D**

**NEW QUESTION # 139**

A business analyst is using a client table and an invoice table to create a database view that shows clients who have not made purchases yet. Which of the following joins is most appropriate for the analyst to use to create this database view?

- A. INNER JOIN ON Client.Key = Invoice.Key
- B. LEFT JOIN ON Client.Key = Invoice.Key
- C. RIGHT JOIN ON Client.Key = Invoice.Key WHERE BY Client.Key IS NULL
- D. LEFT JOIN ON Client.Key = Invoice.Key WHERE BY Invoice.Key IS NULL

**Answer: D**

Explanation:

The join that is most appropriate for the analyst to use to create this database view is option D.

This join uses the LEFT JOIN clause to combine the client table and the invoice table based on the matching values in the Key

column. The WHERE clause filters out the rows where the Invoice.Key column is not null, meaning that the client has made a purchase. The result is a view that shows only the clients who have not made any purchases yet. The other options either do not produce the desired result or have syntax errors. For example, option A would show only the clients who have made purchases, option B would show only the invoices that do not have a matching client, and option C would show all the clients regardless of their purchase status.

#### NEW QUESTION # 140

A database administrator wants to create a database that does not have a predefined schema. Which of the following tools should the administrator use to create this type of database? (Choose two.)

- A. SQL Server
- B. MySQL
- C. MongoDB
- D. PostgreSQL
- E. Cosmos
- F. MariaDB

**Answer: C,E**

#### NEW QUESTION # 141

A programmer wants to configure a database to only allow read or write access when requests are coming from specific IP addresses. Which of the following can be used to configure IP addresses to allow access to the database?

- A. Firewall
- B. Static IP address
- C. Dynamic IP address
- D. IDNS

**Answer: A**

Explanation:

The best option to configure IP addresses to allow access to the database is a firewall. A firewall is a network device or software that controls the incoming and outgoing traffic based on a set of rules or policies. A firewall can be used to filter the traffic by IP addresses, ports, protocols, or other criteria, and allow or deny access to the database accordingly. The other options are either not relevant or not sufficient for this task. For example, a static IP address is an IP address that does not change over time, but it does not determine the access to the database; a dynamic IP address is an IP address that changes periodically, but it does not control the traffic to the database; an IDNS is an Internet Domain Name System, which translates domain names into IP addresses, but it does not regulate the access to the database. Reference: CompTIA DataSys+ Course Outline, Domain 4.0 Data and Database Security, Objective 4.2 Given a scenario, implement security controls for databases.
