CompTIA DS0-001 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">• Data and Database Security: This topic focuses on data security concepts, governance and regulatory compliance purposes, implementing authentication and authorization policies and best practices. Additionally, the topic discusses database infrastructure security, and understanding types of attacks and their effects on data systems.

Topic 2	<ul style="list-style-type: none"> • Business Continuity: Finally, this topic covers the importance of disaster recovery techniques. Moreover, the topic explains backup and restore best practices and processes.
Topic 3	<ul style="list-style-type: none"> • Database Fundamentals: This topic covers database structure types, SQL code development and modification based on scenarios, comparison of scripting methods and environments, and the impact of programming on database operations.
Topic 4	<ul style="list-style-type: none"> • Database Deployment: In this topic, you'll find discussions on database planning and design aspects. It also focuses on the implementation, testing, and deployment phases of databases.
Topic 5	<ul style="list-style-type: none"> • Database Management and Maintenance: Here, you'll learn about monitoring and reporting for database management and performance, common database maintenance processes, documentation production, and relevant tools usage. Lastly, the topic focuses on implementing data management tasks.

To make an open entrance and cash, everybody should gather themselves with the right and built up base on material for CompTIA DS0-001. The top-notch highlights are given to clients to affect the essential undertaking in certification. Every one of you can test your course of action with CompTIA DS0-001 Dumps by giving the phony test. Mock tests are outstandingly worked for you to make heads or tails of your goofs while giving CompTIA DS0-001.

CompTIA DataSys+ Certification Exam Sample Questions (Q76-Q81):

NEW QUESTION # 76

A business analyst is using a client table and an invoice table to create a database view that shows clients who have not made purchases yet. Which of the following joins is most appropriate for the analyst to use to create this database view?

- A. RIGHT JOIN ON Client.Key = Invoice.Key WHERE BY Client.Key IS NOLL
- B. LEFT JOIN ON Client.Key = Invoice.Key
- **C. LEFT JOIN ON Client.Key = Invoice.Key WHERE BY Invoice.Key IS NOLL**
- D. INNER JOIN ON Client.Key = Invoice.Key

Answer: C

Explanation:

The join that is most appropriate for the analyst to use to create this database view is option D. This join uses the LEFT JOIN clause to combine the client table and the invoice table based on the matching values in the Key column. The WHERE clause filters out the rows where the Invoice.Key column is not null, meaning that the client has made a purchase. The result is a view that shows only the clients who have not made any purchases yet. The other options either do not produce the desired result or have syntax errors. For example, option A would show only the clients who have made purchases, option B would show only the invoices that do not have a matching client, and option C would show all the clients regardless of their purchase status. NEW QUESTION # 77

A database administrator needs to ensure continuous availability of a database in case the server fails. Which of the following should the administrator implement to ensure high availability of the database?

- A. Database dumping
- B. ETL
- **C. Replication**
- D. Backup and restore

Answer: C

Explanation:

The option that the administrator should implement to ensure high availability of the database is replication. Replication is a process that copies and synchronizes data from one database server (the primary or source) to one or more database servers (the secondary or target). Replication helps ensure high availability of the database by providing redundancy, fault tolerance, and load balancing. If the primary server fails, the secondary server can take over and continue to serve the data without interruption or data loss. The other options are either not related or not suitable for this purpose. For example, ETL is a process that extracts, transforms, and loads data from one source to another for analysis or reporting purposes; database dumping is a process that exports the entire content of a database to a file for backup or migration purposes; backup and restore is a process that copies and recovers data from a backup device or media in case of a disaster or corruption. Reference: CompTIA DataSys+ Course Outline, Domain 5.0 Business Continuity, Objective 5.3 Given a scenario, implement replication of database management systems.

NEW QUESTION # 78

Which of the following tools is used for natively running a Linux system in Windows?

- A. SSH
- **B. WSL**
- C. Remote Desktop Protocol
- D. Telnet

Answer: B

Explanation:

The tool that is used for natively running a Linux system in Windows is WSL. WSL, or Windows Subsystem for Linux, is a feature that allows users to run a Linux system natively on Windows 10 or Windows Server. WSL enables users to install and use various Linux distributions, such as Ubuntu, Debian, Fedora, etc., and run Linux commands, tools, applications, etc., without requiring a virtual machine or a dual-boot setup. WSL also provides users with interoperability and integration between Linux and Windows, such as file system access, network communication, process management, etc. WSL is useful for users who want to use Linux features or functionalities on Windows, such as development, testing, scripting, etc. The other options are either different tools or not related to running a Linux system in Windows at all. For example, Remote Desktop Protocol (RDP) is a protocol that allows users to remotely access and control another computer or device over a network; SSH, or Secure Shell, is a protocol that allows users to securely connect and communicate with another computer or device over a network; Telnet is a protocol that allows users to interact with another computer or device over a network using a text-based interface.

NEW QUESTION # 79

Which of the following is a characteristic of a multizone region in a disaster recovery policy?

- **A. Three or more availability zones**
- B. A single geographic location
- C. Application high availability
- D. Active/active deployment on secondary zones

Answer: A

Explanation:

A multizone region in disaster recovery involves distributing resources across three or more availability zones to ensure resilience and fault tolerance within a single geographic region.

NEW QUESTION # 80

A group of developers needs access to a database in a development environment, but the database contains sensitive data. Which of the following should the database administrator do before giving the developers access to the environment?

- A. Remove sensitive data from tables.
- B. Audit access to tables with sensitive data.
- C. Encrypt connections to the development environment.
- **D. Mask the sensitive data.**

Answer: D
