They work together and share their expertise to maintain the top standard of Terraform-Associate-003 exam practice test. So you can get trust on Terraform-Associate-003 exam questions and start preparing today.

HashiCorp Certified: Terraform Associate (003) (HCTA0-003) Sample Questions (Q82-Q87):

NEW QUESTION # 82

You have a Terraform configuration that defines a single virtual machine with no references to it, You have run terraform apply to create the resource, and then removed the resource definition from your Terraform configuration file. What will happen you run terraform apply in the working directory again?

- A. Terraform will error
- **B. Terraform will destroy the virtual machine**
- C. Terraform will remove the virtual machine from the state file, but the resource will still exist
- D. Nothing

Answer: B

Explanation:

This is what will happen if you run terraform apply in the working directory again, after removing the resource definition from your Terraform configuration file. Terraform will detect that there is a resource in the state file that is not present in the configuration file, and will assume that you want to delete it.

NEW QUESTION # 83

While attempting to deploy resources into your cloud provider using Terraform, you begin to see some odd behavior and experience slow responses. In order to troubleshoot you decide to turn on Terraform debugging. Which environment variables must be configured to make Terraform's logging more verbose?

- A. TF_LOG
- B. TF_VAR_log_path
- C. TF_VAR_log_level
- D. TF_LOG_PATH

Answer: A

Explanation:

To make Terraform's logging more verbose for troubleshooting purposes, you must configure the TF_LOG environment variable. This variable controls the level of logging and can be set to TRACE, DEBUG, INFO, WARN, or ERROR, with TRACE providing the most verbose output.

Reference = Detailed debugging instructions and the use of environment variables like TF_LOG for increasing verbosity are part of Terraform's standard debugging practices

NEW QUESTION # 84

A senior admin accidentally deleted some of your cloud instances. What will Terraform do when you run terraform apply?

- A. Stop and generate an error message about the missing instances.
- B. Build a completely brand new set of infrastructure.
- C. Tear down the entire workspace's infrastructure and rebuild it.
- D. Rebuild only the instances that were deleted.

Answer: D

Explanation:

Comprehensive and Detailed in-Depth Explanation: Terraform detects infrastructure drift by comparing the state file with the actual infrastructure.

* When an instance is manually deleted, Terraform sees it as missing and marks it for recreation.

* Running terraform apply will only recreate the missing instances while leaving the rest of the infrastructure unchanged.

Explanation of incorrect answers:

* A (Tear down everything and rebuild)- Incorrect. Terraform does not destroy existing infrastructure unless explicitly told to.

* B (Build a completely new set of infrastructure)- Incorrect. Terraform does not create duplicates unless configuration changes.

* D (Stop and error out)- Incorrect. Terraform does not fail; it rebuilds missing resources automatically.

Official Terraform Documentation Reference: Handling Infrastructure Drift

NEW QUESTION # 85

You have created a main.tf Terraform configuration consisting of an application server, a database and a load balancer. You ran terraform apply and Terraform created all of the resources successfully.

Now you realize that you do not actually need the load balancer, so you run terraform destroy without any flags. What will happen?

- A. Terraform will prompt you to pick which resource you want to destroy
- B. Terraform will destroy the main, tf file
- C. Terraform will destroy the application server because it is listed first in the code
- D. Terraform will prompt you to confirm that you want to destroy all the infrastructure
- E. Terraform will immediately destroy all the infrastructure

Answer: D

Explanation:

Explanation

This is what will happen if you run terraform destroy without any flags, as it will attempt to delete all the resources that are associated with your current working directory or workspace. You can use the -target flag to specify a particular resource that you want to destroy.

NEW QUESTION # 86

If you manually destroy infrastructure, what is the best practice reflecting this change in Terraform?

- A. Run terraform refresh
- **B. It will happen automatically**
- C. Manually update the state file
- D. Run terraform import

Answer: B

Explanation:

Explanation

If you manually destroy infrastructure, Terraform will automatically detect the change and update the state file during the next plan or apply. Terraform compares the current state of the infrastructure with the desired state in the configuration and generates a plan to reconcile the differences. If a resource is missing from the infrastructure but still exists in the state file, Terraform will attempt to recreate it. If a resource is present in the infrastructure but not in the state file, Terraform will ignore it unless you use the terraform import command to bring it under Terraform's management.
