What should this endpoint return? http://dev.acme.com/api/patients?name=John & surname=Bell

- **A. Patients with name as John and surname as Bell**
- B. Patient with surname as bell
- C. Patient with name as John
- D. Patients with either name as John or surname as Bell

Answer: A

Explanation:

Query parameters are a defined set of parameters attached to the end of a url. They are extensions of the URL that are used to help define specific content or actions based on the data being passed. To append query params to the end of a URL, a '?' is added followed immediately by a query parameter.

To add multiple parameters, an '&' is added in between each.

Hence coming back to question, endpoint would return Patients with name as John and (and is very important here) surname as Bell

include like:

types:

Book: !include bookDataType.raml and

examples:

input: !include bookExample.raml
