### Peoplecert ITIL 4 Practitioner: Release Management Exam Sample Questions (Q11-Q16):

#### NEW QUESTION # 11

An organization has a dedicated release management team that is effective in managing releases, but this team has very poor coordination with the change enablement team. What capability level of release management does this indicate?

- A. Level 4
- B. Level 1
- C. Level 3
- **D. Level 2**

**Answer: D**

Explanation:

The ITIL capability model evaluates not only the effectiveness of a practice but also its integration with other practices. The ITIL 4 Practitioner: Release Management document states: "Level 2 (Managed) indicates that the practice is effective in its own scope but may lack integration with other practices. Level 3 (Defined) requires standardized processes and effective coordination with related practices like change enablement" (Section 5.2).

\* The scenario shows that the release management team is effective (meeting Level 2), but poor coordination with the change enablement team indicates a lack of integration.

\* Level 1 (Ad-hoc) would mean no consistent process, which isn't the case here since the team is effective.

\* Level 3 requires integration and standardization across practices, which is not met due to poor coordination.

\* Level 4 is even more advanced, requiring quantitative management, which isn't applicable.

The capability level is B (Level 2), as the practice is effective but lacks the integration needed for Level 3.

#### NEW QUESTION # 12

A release manager has decided on a policy of not allowing users to choose to accept software updates. What is this an example of?

- A. A 'pull' approach
- **B. A 'push' approach**
- C. Continuous delivery
- D. Continuous integration

**Answer: B**

Explanation:

The ITIL 4 Practitioner: Release Management document explains the difference between push and pull approaches in release management: "In a push approach, updates are deployed to users without giving them a choice, often to ensure compliance or security. In a pull approach, users can choose when to adopt updates" (Section 3.2.3).

\* Option A (A 'pull' approach) is incorrect because a pull approach allows users to choose when to accept updates, which contradicts the scenario.

\* Option B (A 'push' approach) is correct, as the policy of not allowing users to choose means the updates are automatically deployed to them, fitting the definition of a push approach.

\* Option C (Continuous delivery) and Option D (Continuous integration) are development practices, not release deployment strategies. Continuous delivery involves making releases available frequently, but it doesn't specify whether users must accept them.

(push) or can choose (pull).

The scenario describes a push approach, making B the correct answer.

### NEW QUESTION # 13

A service provider is reviewing its release management practice. It has been found that most releases meet their objectives and are delivered on time. However, teams and organizations using the service provider's services are complaining that sometimes software updates interrupt their work during peak business hours.

What should the service provider do to improve the release management practice by applying the 'collaborate and promote visibility' guiding principle?

- A. Do not overcomplicate the practice
- **B. Ensure an excellent user experience**
- C. Optimize the practice for the value streams
- D. Review the effectiveness of release models

**Answer: B**

Explanation:

The 'collaborate and promote visibility' guiding principle in ITIL 4 emphasizes working with stakeholders to ensure transparency and alignment with their needs. The ITIL 4 Practitioner: Release Management document advises: "Applying the 'collaborate and promote visibility' principle involves working closely with stakeholders, such as service consumers, to understand their needs and ensure releases do not disrupt their operations, thereby ensuring an excellent user experience" (Section 5.1).

\* The issue is that updates interrupt work during peak hours, indicating a lack of collaboration with users to understand their schedules and needs.

\* Option A (Ensure an excellent user experience) directly addresses this by implying collaboration with users to schedule releases at non-disruptive times, aligning with the principle.

\* Option B (Review the effectiveness of release models) is an internal activity and doesn't directly involve collaboration with stakeholders.

\* Option C (Optimize the practice for the value streams) focuses on value stream efficiency but doesn't specifically address user collaboration.

\* Option D (Do not overcomplicate the practice) is unrelated to the collaboration principle.

The correct answer is A, as ensuring an excellent user experience through collaboration directly applies the principle to address the issue.

### NEW QUESTION # 14

What automation tools should be used to help a release manager understand how the organization's services are related to one another?

- **A. Enterprise architecture tools**
- B. Monitoring and event management tools
- C. Analysis and reporting tools
- D. Work planning and prioritization tools

**Answer: A**

Explanation:

Understanding service relationships is critical for effective release management, especially to assess the impact of releases. The ITIL 4 Practitioner: Release Management document states: "Enterprise architecture tools help release managers understand the relationships between services, applications, and infrastructure, enabling better impact analysis and dependency mapping for releases" (Section 4.2).

\* Option A (Analysis and reporting tools) focuses on performance metrics, not service relationships.

\* Option B (Work planning and prioritization tools) aids in scheduling, not understanding service dependencies.

\* Option C (Monitoring and event management tools) is used for real-time performance tracking, not structural relationships.

\* Option D (Enterprise architecture tools) is the correct choice, as these tools map out service relationships and dependencies, helping the release manager plan releases effectively.

The correct answer is D, as enterprise architecture tools are designed for this purpose.

### NEW QUESTION # 15

An organization manually checks that releases of new or changed products/services have been successfully completed. Which tools should be used to automate this process?

- A. Enterprise architecture tools
- B. Workflow management and collaboration tools
- **C. Monitoring and event management tools**
- D. Analysis and reporting tools

**Answer: C**

Explanation:

Automating the verification of release success involves tracking the performance and stability of the released services. The ITIL 4 Practitioner: Release Management document notes: "Monitoring and event management tools can automate the verification of release success by tracking system performance and detecting anomalies post-release, ensuring the release meets its objectives" (Section 4.2).

\* Option A (Monitoring and event management tools) is correct, as these tools can automatically check system health and performance after a release, replacing manual checks.

\* Option B (Workflow management and collaboration tools) focuses on process coordination, not post-release verification.

\* Option C (Enterprise architecture tools) is used for dependency mapping, not release verification.

\* Option D (Analysis and reporting tools) provides retrospective insights but doesn't automate real-time verification.

The correct answer is A, as monitoring tools are best suited for automating release verification.
