Snowflake SnowPro® Core Certification (COF-C03) Sample Questions (Q303-Q308):

NEW QUESTION # 303

Which is the MINIMUM required Snowflake edition that a user must have if they want to use AWS/Azure Privatelink or Google Cloud Private Service Connect?

- A. Premium
- B. Standard
- C. Business Critical
- D. Enterprise

Answer: C

Explanation:

NEW QUESTION # 304

What causes objects in a data share to become unavailable to a consumer account?

- A. The DATA_RETENTION_TIME_IN_DAYS parameter in the consumer account is set to 0.
- **B. The objects in the data share are being deleted and the grant pattern is not re-applied systematically.**
- C. The consumer account acquires the data share through a private data exchange.
- D. The consumer account runs the GRANT IMPORTED PRIVILEGES command on the data share every 24 hours.

Answer: B

Explanation:

Objects in a data share become unavailable to a consumer account if the objects in the data share are deleted or if the permissions on these objects are altered without re-applying the grant permissions systematically. This is because the sharing mechanism in Snowflake relies on explicit grants of permissions on specific objects (like tables, views, or secure views) to the share. If these objects are deleted or if their permissions change without updating the share accordingly, consumers can lose access.

The DATA_RETENTION_TIME_IN_DAYS parameter does not directly affect the availability of shared objects, as it controls how long Snowflake retains historical data for time travel and does not impact data sharing permissions.

Running the GRANT IMPORTED PRIVILEGES command in the consumer account is not related to the availability of shared objects; this command is used to grant privileges on imported objects within the consumer's account and is not a routine maintenance command that would need to be run regularly.

Acquiring a data share through a private data exchange does not inherently make objects unavailable; issues would only arise if there were problems with the share configuration or if the shared objects were deleted or had their permissions altered without re-granting access to the share.

NEW QUESTION # 305

Which of the following describes how multiple Snowflake accounts in a single organization relate to various cloud providers?

- A. All Snowflake accounts must be hosted in the same cloud vendor and region
- B. Each Snowflake account must be hosted in a different cloud vendor and region
- C. Each Snowflake account can be hosted in a different cloud vendor, but must be in the same region.
- **D. Each Snowflake account can be hosted in a different cloud vendor and region.**

Answer: D

Explanation:

Snowflake's architecture allows for flexibility in account hosting across different cloud vendors and regions. This means that within a single organization, different Snowflake accounts can be set up in various cloud environments, such as AWS, Azure, or GCP, and in different geographical regions. This allows organizations to leverage the global infrastructure of multiple cloud providers and optimize their data storage and computing needs based on regional requirements, data sovereignty laws, and other considerations.

NEW QUESTION # 306

The effects of query pruning can be observed by evaluating which statistics? (Select TWO).

- A. Partitions total
- B. Bytes written
- **C. Partitions scanned**
- D. Bytes read from result
- **E. Bytes scanned**

Answer: C,E

Explanation:

Query pruning in Snowflake refers to the optimization technique where the system reduces the amount of data scanned by a query based on the query conditions. This typically involves skipping unnecessary data partitions that do not contribute to the query result.

The effectiveness of this technique can be observed through:

Option A: Partitions scanned. This statistic indicates how many data partitions were actually scanned as a result of query pruning, showing the optimization in action.

Option C: Bytes scanned. This measures the volume of data physically read during query execution, and a reduction in this number indicates effective query pruning, as fewer bytes are read when unnecessary partitions are skipped.

Options B, D, and E do not directly relate to observing the effects of query pruning. "Partitions total" shows the total available, not the impact of pruning, while "Bytes read from result" and "Bytes written" relate to output rather than the efficiency of data scanning. NEW QUESTION # 307

Which Snowflow object does not consume and storage costs?

- A. Secure view
- B. Transient table
- C. Materialized view
- **D. Temporary table**

Answer: D

Explanation:

Temporary tables in Snowflake do not consume storage costs. They are designed for transient data that is needed only for the duration of a session. Data stored in temporary tables is held in the virtual warehouse's cache and does not persist beyond the session's lifetime, thereby not incurring any storage charges.
