The best of SAP certification C_CPI_2506 exam test software

You can take advantage of several perks if you buy Exam4Tests's bundle package of SAP C_CPI_2506 dumps. The bundle package is cost-effective and includes all three formats of SAP Certified Associate - Integration Developer exam preparation material SAP C_CPI_2506 PDF Dumps Questions Answers, and SAP C_CPI_2506 Practice Test software (online and offline). SAP C_CPI_2506 Dumps are worth trying while preparing for the exam. You will be sure of what SAP C_CPI_2506 exam questions will be asked in the exam.

SAP Certified Associate - Integration Developer Sample Questions (Q39-Q44):

NEW QUESTION # 39

How do you configure a SOAP adapter for asynchronous processing?

- A. Message Exchange Pattern: Request-Reply Process Settings Robust
- B. Message Exchange Pattern: Request-Reply Process Settings WS Standard
- C. Message Exchange Pattern: One-Way Process Settings: WS Standard
- D. Message Exchange Pattern: One-Way Process Settings: Robust

Answer: C

Explanation:

To configure a SOAP adapter for asynchronous processing, you must set the message exchange pattern to one-way and the process settings to WS standard. The message exchange pattern defines how the sender and receiver communicate with each other using SOAP messages. The one-way pattern means that the sender sends a message to the receiver without expecting a response. The process settings define how the SOAP adapter handles errors and acknowledgements during message processing. The WS standard setting means that the SOAP adapter uses WS-ReliableMessaging protocol to ensure reliable delivery of messages and WS-Addressing protocol to identify the endpoints and actions of messages. Reference: Configure the SOAP (SOAP 1.x) Sender Adapter | SAP Help Portal, Configure the SOAP (SOAP 1.x) Receiver Adapter | SAP Help Portal

NEW QUESTION # 40

What are API Management components? Note: There are 2 correct answers to this question.

- A. API Designer
- B. Authorization server
- C. Product
- D. API Entity

Answer: A,C

Explanation:

Key API Management components in SAP Integration Suite:

API Designer # Used to design APIs, import specifications (OpenAPI, RAML), and define metadata.

Product # Groups one or more APIs into a package that can be published to API Business Hub Enterprise.

Other options:

Authorization Server # Part of security infrastructure, not a direct API Management component.

API Entity # Not a defined component; the actual entities are API Proxies, Providers, and Products.

Thus, correct components are API Designer and Product.

NEW QUESTION # 41

You want to build an architecture that is largely asynchronous. Which design do you use to exchange notifications between the partners involved?

- A. Request-driven design
- B. Serverless design
- C. Event-driven design
- D. Hexagonal design

Answer: C

Explanation:

You can use an OData adapter to implement a synchronous call to a remote HTTP API as an integration flow component. An OData adapter allows you to send and receive messages using the OData protocol. OData stands for Open Data Protocol and is a standard for exposing and consuming data over HTTP or HTTPS. You can use an OData adapter to communicate with OData services that support CRUD (Create, Read, Update, Delete) operations on resources. Reference: Integration Software | SAP Integration Suite, Modernize Integration with SAP Integration Suite | openSAP

NEW QUESTION # 42

In your integration flow process, the request reply returns a message with namespaces. What can you do to delete namespaces from this message? Note: There are 2 correct answers to this question.

- A. Set up the request reply to delete the namespaces
- **B. Use an XSLT mapping.**
- **C. Use a Content Modifier**
- D. Set up the namespace mapping in the Runtime Configuration.

Answer: B,C

Explanation:

A Content Modifier is a step in an integration flow that allows you to modify the message header or body using expressions or constants. You can use a Content Modifier to delete namespaces from a message by using expressions that remove the namespace declarations or prefixes from the XML elements or attributes. For example, you can use the expression `replace($body,"xmlns:ns[0-9]+="`
