CrowdStrike Certified Cloud Specialist - 2025 Version Sample Questions (Q307-Q312):

NEW QUESTION # 307

While auditing your cloud environment, you need to identify the last time a specific user changed their password. Which of the following actions should you take in CrowdStrike Identity Analyzer to retrieve this information?

- A. Review the "Access Permissions" tab for the user to find the password change timestamp.
- B. Use the "Password Change Insights" feature in the Identity Analyzer dashboard.

- C. Navigate to the user's activity logs and filter by "Authentication Events."
- D. Query the cloud provider's API directly for password change events.

Answer: B

Explanation:

Option A: The "Access Permissions" tab focuses on roles, policies, and entitlements. It does not store password change history, making this option incorrect.

Option B: Authentication events show login attempts and session data but do not track password changes. This approach would not yield the desired information.

Option C: The "Password Change Insights" feature in CrowdStrike Identity Analyzer provides a centralized and user-friendly interface to track password change events. It is specifically designed for auditing and identifying such activity efficiently without relying on external tools or manual log searches.

Option D: While querying the cloud provider's API might work, it is time-consuming and requires advanced knowledge of the API. CrowdStrike Identity Analyzer already consolidates this information, making this step unnecessary.

NEW QUESTION # 308

During a routine audit, you discover that multiple endpoints in your CrowdStrike Falcon inventory are missing critical metadata, such as hostname and operating system details. What is the most effective way to resolve this issue and maintain an accurate asset inventory?

- A. Deploy the Falcon sensor on the affected endpoints to collect detailed telemetry.
- B. Remove the endpoints from the inventory to prevent confusion.
- C. Ignore the issue, as the devices will update themselves automatically over time.
- D. Reassign the endpoints to a different group within the platform.

Answer: A

Explanation:

Option A: The Falcon sensor provides detailed telemetry, including metadata such as hostname, operating system, and other critical details. Deploying the sensor ensures the inventory is accurate and up-to-date, enabling effective monitoring and management.

Option B: Removing endpoints creates blind spots in the inventory and security monitoring.

Properly identifying and managing them is critical for maintaining security posture.

Option C: Relying on automatic updates without addressing the root cause may leave critical gaps in asset visibility and management. Proactive action is necessary.

Option D: Reassigning the endpoints does not resolve the underlying issue of missing metadata.

The problem requires deploying the sensor to collect accurate data.

NEW QUESTION # 309

Which setting is configurable when editing a Falcon cloud security posture policy?

- A. Enabling real-time detection for malware in S3 buckets.
- B. Adjusting the logging level of cloud provider APIs.
- C. Assigning priority levels to specific misconfiguration rules.
- D. Activating Falcon sensors for unmanaged endpoints.

Answer: C

Explanation:

Option A: When editing a cloud security posture policy, administrators can assign priority levels or severities (e.g., critical, high, medium, low) to specific rules. This helps in categorizing and addressing misconfigurations based on their impact on security and compliance.

Option B: Falcon sensors are activated and managed separately from cloud security posture policies. The policies focus on cloud configuration assessments, not endpoint management.

Option C: Falcon cloud security posture policies are focused on misconfigurations and compliance, not real-time malware detection. Real-time malware scanning in S3 buckets would be managed by a separate feature or service.

Option D: Cloud provider API logging levels are managed in the respective cloud provider's settings, not within Falcon's cloud security posture policy configurations.

NEW QUESTION # 310

You need to update the registry connection details for an existing container registry in the CrowdStrike Falcon console. What is the correct sequence of steps to edit the connection details?

- A. Access the "Integrations" page, select the container registry, and update the credentials under "API Keys."
- **B. Navigate to the "Image Assessment" page, select the registry, click "Edit," modify the settings, and save changes.**
- C. Export the existing connection settings, update them in a JSON file, and re-upload to the CrowdStrike console.
- D. Go to the "Cloud Connections" tab, select the registry, delete the existing connection, and create a new one with updated details.

Answer: B

Explanation:

Option A: CrowdStrike does not support exporting and re-uploading connection settings as JSON files for editing purposes. All updates must be done within the console's UI.

Option B: This is the standard procedure for editing registry connection details in the CrowdStrike Falcon console. The "Image Assessment" page is specifically designed to manage container registry connections, including editing settings such as credentials or URLs.

Option C: The "Integrations" page manages broader integrations but is not specifically for editing container registry connection details. API keys are not directly linked to registry connection settings.

Option D: Deleting the existing connection and creating a new one is unnecessary and inefficient.

Editing the connection directly avoids the loss of historical configuration or integration settings.

NEW QUESTION # 311

An organization is planning to deploy the CrowdStrike Kubernetes protection agent to secure their containerized workloads. Which of the following is a prerequisite for deploying the Kubernetes protection agent?

- A. The organization must enable automatic pod scaling before installing the Kubernetes protection agent.
- B. Each Kubernetes node must have Docker installed as the only supported container runtime.
- C. The Kubernetes cluster must be running on bare-metal hardware, as cloud-based clusters are unsupported.
- **D. The Kubernetes cluster must have internet access to connect to CrowdStrike's cloud.**

Answer: D

Explanation:

Option A: This is incorrect because CrowdStrike supports Kubernetes clusters running in both on-premises and cloud-based environments, including managed services like Amazon EKS, Azure AKS, and Google GKE.

Option B: This is incorrect because while Docker is supported, the Kubernetes protection agent also supports other container runtimes like containerd. Requiring Docker exclusively is a misconception.

Option C: This is incorrect as automatic pod scaling is unrelated to the deployment of the Kubernetes protection agent. It is not a requirement and has no impact on the agent's functionality.

Option D: CrowdStrike's Kubernetes protection agent communicates with the CrowdStrike Falcon platform in the cloud. Internet access is a critical requirement to enable this communication.

Without it, the agent cannot send telemetry data or receive updates.
