PTCE[®] 
Pharmacy Technician
Certification Exam
Premium
FOR THE LATEST EXAM BLUEPRINT

- 4 full-length practice tests with detailed answer explanations
- Online practice with a timed test option and scoring
- Detailed content review and practice for all topics on the exam
- Expert advice on exam scoring, recertification, and more

 **ONLINE PRACTICE** Sacha Koborsi-Iadros, PharmD

PTCE® is a registered trademark of the Pharmacy Technician Certification Board, which neither sponsors nor endorses this product.

You can also accelerate your career with the Ping Identity PT-AM-CPE certification if you study with our PT-AM-CPE actual exam questions. We are certain that with these Ping Identity PT-AM-CPE real exam questions you will easily prepare and clear the Ping Identity PT-AM-CPE test in a short time. The only goal of RealValidExam is to help you boost the Ping Identity PT-AM-CPE test preparation in a short time. To meet this objective, we offer updated and actual Certified Professional - PingAM Exam Expert PT-AM-CPE Exam Questions in three easy-to-use formats. These formats are Ping Identity PDF Questions file, desktop Ping Identity PT-AM-CPE practice test software, and Ping Identity PT-AM-CPE web-based practice exam. All these three formats of our updated Ping Identity PT-AM-CPE exam product have valid, actual, updated, and error-free PT-AM-CPE test questions. You can quickly get fully prepared for the test in a short time by using our PT-AM-CPE pdf questions.

We know that the standard for most workers become higher and higher; so we also set higher goal on our PT-AM-CPE guide questions. Our training materials put customers' interests in front of other points, committing us to the advanced PT-AM-CPE learning materials all along. Until now, we have simplified the most complicated PT-AM-CPE Guide questions and designed a straightforward operation system, with the natural and seamless user interfaces of PT-AM-CPE exam question grown to be more fluent, we assure that our practice materials provide you a total ease of use.

Free PDF Quiz Authoritative PT-AM-CPE - Certified Professional - PingAM Exam Excellect Pass Rate

The Ping Identity PT-AM-CPE practice exam software also has a feature to track all of the scores you earned this whole time. If

your scores don't seem to be satisfying, we encourage you to repeat the learning process and then take another session of Ping Identity PT-AM-CPE practice exam questions simulation. As explained before, the PT-AM-CPE practice Q&A comes in two different formats. The installable one is installable on any Windows computer without requiring an internet connection. Ping Identity PT-AM-CPE Practice exam software allows you to take the tests multiple times without any recurring questions. At the end of every PT-AM-CPE Practice Test, you will see your score on the screen. Whenever there is a change in the Ping Identity PT-AM-CPE exam syllabus our subject matter experts updates the Ping Identity exam questions according to it. The sooner you start preparing, the higher your chance to excel on your Certified Professional - PingAM Exam PT-AM-CPE exam. Don't gamble your future. Get a grab on the Ping Identity PT-AM-CPE braindumps questions for the Certified Professional - PingAM Exam exam to boost your career!.

Ping Identity Certified Professional - PingAM Exam Sample Questions (Q45-Q50):

NEW QUESTION # 45

What should be executed to ensure a successful upgrade when PingAM requires a version upgrade?

- A. Post-upgrade, run a set of non-functional tests
- B. Post-upgrade, set the PingAM Version Control Flag to the correct version
- **C. Post-upgrade, run a set of functional and non-functional tests**
- D. Post-upgrade, run a set of functional tests

Answer: C

Explanation:

Upgrading PingAM 8.0.2 is a complex process that involves updating binaries, modifying schemas in the configuration store, and potentially migrating scripts to the "Next-Generation" scripting engine. To ensure that the system is not only "running" but also "production-ready," a comprehensive testing phase is required.

According to the "Post-Upgrade Tasks" and "Best Practices for Upgrading" documentation:

A successful upgrade verification must cover two distinct categories of testing:

Functional Tests: These verify that the core features still work as intended. Can users log in? Do the authentication trees execute correctly? Are SAML assertions being generated? This ensures the "Logic" of the identity platform is intact.

Non-Functional Tests: These are equally critical in an upgrade scenario. An upgrade can sometimes introduce performance regressions, change the way memory is utilized by the JVM, or alter the connection pool behavior to the CTS. Testing for performance, high availability (failover), security (vulnerability scanning), and monitoring ensures the system can handle production loads and meets the organization's Service Level Agreements (SLAs).

While setting version flags (Option D) might be a technical step in some internal processes, it does not "ensure a successful upgrade" in the way that rigorous validation does. Running only functional tests (Option A) or only non-functional tests (Option C) leaves the environment vulnerable to either logic errors or system crashes. Thus, the verified best practice is to run both functional and non-functional tests (Option B) before redirecting production traffic to the upgraded instances.

NEW QUESTION # 46

A user enters their credentials, but is faced with the error message "user requires profile to login". What is a possible cause of this message?

- **A. The realm has not been set to user profile ignore mode**
- B. Policies have not been defined to allow a user to access their profile page
- C. The user has not filled in the required information in their profile
- D. The user has not entered the correct credentials

Answer: A

Explanation:

This error message is directly related to the User Profile configuration within a specific realm in PingAM 8.0.2. In the "Core Authentication Attributes" of a realm, PingAM defines how it should handle user identities after they have successfully provided valid credentials through an authentication tree or chain.

There are primarily four modes for the User Profile setting:

Required: This is often the default. It specifies that after a user successfully authenticates, PingAM must be able to locate a corresponding user entry in the configured Identity Store. If the user exists in the datastore, the session is created. If the user does not exist, authentication fails with the error message "user requires profile to login" (or a similar profile-related exception in the logs).

Ignored: In this mode, PingAM issues an SSO session token immediately upon successful credential validation, regardless of

whether a user profile exists in the back-end repository. This is useful for temporary or guest access where no permanent record is needed.

Dynamic: AM attempts to find the user; if the user is not found, it automatically creates a new profile in the identity store.

Dynamic with User Alias: Similar to dynamic creation but supports aliasing.

If an administrator sees the "user requires profile to login" error, it confirms that the credentials themselves were technically correct (the user passed the authentication nodes), but the realm is currently in Required mode (it has not been set to Ignore or Dynamic) and no matching entry exists in the identity store. This frequently happens in migration scenarios or when using external identity providers (like Social IDPs) where the "Link" or "Provisioning" step has not been properly configured in the authentication journey. To resolve this, the administrator must either pre-provision the user, set the mode to Ignore, or implement a Create Object node within the authentication tree to handle dynamic provisioning.

NEW QUESTION # 47

Which OAuth2 web endpoint is used to validate a token?

- A. /oauth2/validate
- B. /oauth2/access_token
- C. /oauth2/introspect
- D. /oauth2/userinfo

Answer: C

Explanation:

While several endpoints in PingAM 8.0.2 interact with tokens, only one is explicitly designed for the purpose of checking the metadata and validity of an opaque or structured OAuth2 token.

According to the "OAuth 2.0 Endpoints" and "Token Introspection" documentation:

/oauth2/introspect (Option B): This is the RFC 7662-compliant endpoint. It is used by resource servers (or other authorized clients) to determine the "activeness" of a token. When a token is sent to this endpoint, PingAM returns a JSON object indicating if the token is valid, its scope, its expiration time, and the subject it represents. This is the standard way to validate tokens that are not self-validated (like opaque tokens stored in the CTS).

Why other options are incorrect:

/oauth2/userinfo (Option A): This endpoint is part of OpenID Connect. While it requires a valid token to function, its purpose is to return user claims, not to provide a "valid/invalid" metadata check of the token itself.

/oauth2/validate (Option C): This is a legacy endpoint used in older versions of the product. In PingAM 8.0.2, introspection is the standardized replacement.

/oauth2/access_token (Option D): This is the Token Endpoint used to issue tokens, not to validate them.

Using the /oauth2/introspect endpoint is a best practice for security because it allows the authorization server (PingAM) to verify that a token has not been revoked in the Core Token Service (CTS) before a resource server grants access.

NEW QUESTION # 48

When defining a policy and specifying a resource pattern, which of the following statements is true concerning the difference between the wildcards * and -*?

- A. The wildcard * will match multiple levels in a path, whereas -* will match only a single level
- B. The wildcard * will match query parameters, whereas -* will not match query parameters.
- C. Neither the * wildcard nor the -* wildcard can be used to match the port number
- D. The wildcard * and the wildcard -* can be mixed liberally within the same pattern

Answer: A

Explanation:

When configuring Authorization Policies in PingAM 8.0.2, defining the Resource Pattern is critical for determining which URLs the policy applies to. PingAM uses specific wildcard symbols to represent dynamic parts of a URI, but they behave differently regarding directory depth.

According to the PingAM documentation on "Policies and Resource Types":

The * Wildcard (One-Level Wildcard): This wildcard matches characters within a single path level. It does not match forward slashes (/). For example, http://example.com/* will match http://example.com/page1 but will not match http://example.com/folder/page1.

The -* Wildcard (Multi-Level Wildcard): This wildcard is designed to match any number of characters, including forward slashes (/), effectively spanning multiple levels of a directory hierarchy. For example, http://example.com/*- will match

<http://example.com/page1>, <http://example.com/folder/page1>, and even <http://example.com/deeply/nested/resource>. Statement B is the correct technical distinction. Statement A is incorrect because query parameters are typically handled by specifically enabling "Query Parameter Matching" in the Resource Type configuration, rather than being a primary distinction between these two wildcards. Statement C is technically discouraged because mixing them can lead to unpredictable or overly broad matches that are difficult to debug. Statement D is incorrect because wildcards can be used in the host/port portion of the URL if the resource type is configured to support it. Understanding the difference between single-level (*) and multi-level (-*-) matching is a fundamental skill for AM policy administrators to prevent security gaps.

NEW QUESTION # 49

A SAML2 identity provider (IdP) is configured in a subrealm. Which of the following URLs can be used to export the IdP metadata?

- A. It cannot be exported via a JSP, and the Amster tool has to be used
- B. <http://myserver.domain.com:8080/openam/saml2/jsp/exportmetadata.jsp>
- C. <http://myserver.domain.com:8080/openam/saml2/jsp/exportmetadata.jsp?idp=http://myserver.domain.com:8080/openam&realm=/idprealm>
- D. <http://myserver.domain.com:8080/openam/saml2/jsp/exportmetadata.jsp?entityid=http://myserver.domain.com:8080/openam&realm=/idprealm>

Answer: D

Explanation:

To facilitate federation between a SAML2 Identity Provider (IdP) and a Service Provider (SP), metadata must be exchanged. PingAM 8.0.2 provides a built-in utility page, `exportmetadata.jsp`, specifically for this purpose.

When an IdP is configured within a subrealm (rather than the Top Level Realm), the metadata export URL must be qualified with specific query parameters to ensure the correct entity configuration is retrieved. According to the "SAML 2.0 Reference" and "Exporting SAML 2.0 Metadata" documentation:

`entityid`: This parameter is mandatory when there are multiple entities configured. It specifies the unique URI of the IdP (e.g., <http://myserver.domain.com:8080/openam>). This tells the JSP which specific provider's metadata to generate.

`realm`: This parameter is crucial for subrealm deployments. By default, the JSP looks in the root realm (/). If the IdP resides in a subrealm named `/idprealm`, the URL must explicitly include `&realm=/idprealm`.

Option D is the correct technical string. Option B is incorrect as it lacks parameters and would only attempt to export default root-level metadata. Option C is incorrect because the parameter name is `entityid`, not `idp`. While Amster (Option A) can indeed be used to export configuration, the `exportmetadata.jsp` remains the standard and most common method for generating the XML-formatted metadata required by external partners.

NEW QUESTION # 50

.....

You will get real questions and accurate answers from PT-AM-CPE exam pdf torrent for your preparation of PT-AM-CPE certification. When you choose RealValidExam PT-AM-CPE exam dumps, you will enjoy instant access to the PT-AM-CPE practice papers. Moreover, free updates for PT-AM-CPE latest dumps are available for 1 year after the purchase. With the help of the PT-AM-CPE Test Engine, you can not only revisit the mistakes you made, but also can retake tests until you are satisfied. With the practice and PT-AM-CPE valid study material, you will get your Ping Identity PT-AM-CPE certification with ease.
