NEW QUESTION # 54

Match each OSD (Object Storage Device) feature with its description:

| OSD Features | Description |
|-----------------------------|---|
| Flexible data access method | Drives data placement and protection based on the service requirements |
| Metadata-driven policy | Abstracts storage from the application and provides a common view independent of location |
| Data protection | Supports REST/SOAP APIs and the file sharing protocols, CIFS and NFS, for file services |
| Global namespace | Global distribution of objects using either replication or erasure coding |

Answer:

| OSD Features | Description |

| Metadata-driven policy | Drives data placement and protection based on the service requirements |
| Data protection | Global distribution of objects using either replication or erasure coding |
| Global namespace | Abstracts storage from the application and provides a common view independent of location |

#Flexible data access method: Object storage can offer multiple ways to access and interact with stored data, such as REST/SOAP APIs (for object-based access) and file-sharing protocols (CIFS, NFS) for file-level access.

#Metadata-driven policy: Object storage uses rich metadata to define how objects are placed, protected, and managed, driven by policies that respond to service-level requirements.

#Data protection: Object storage systems implement data protection at a global scale through replication or erasure coding to ensure data durability and availability.

#Global namespace: Object storage abstracts physical locations, providing a single namespace (a unified view) so that applications can seamlessly access data regardless of where it physically resides.

NEW QUESTION # 55

Question:

In continuous data protection, what does the amount of journal space determine?

- A. How far back the data can be recovered
- B. Length of time required to recover the data
- C. Amount of data that can be restored to a specific point
- D. Amount of space the source and replica volumes require

Answer: A

Explanation:

In continuous data protection (CDP), journal space stores all the changes made to data over time. The amount of journal space determines the retention window, i.e., how far back in time data can be recovered. A larger journal allows for a longer recovery window.

* Amount of space the source and replica volumes require:Relates to storage capacity, not recovery time.

* Length of time required to recover the data:Depends on system performance and data size.

* Amount of data that can be restored to a specific point:Depends on the changes captured in the journal.

NEW QUESTION # 56

Question:

An organization wants to consume compute, network, and storage resources through a self-service portal.

Which cloud service model provides this capability?

- A. Data as a Service
- B. Software as a Service
- C. Platform as a Service
- D. **Infrastructure as a Service**

Answer: D

Explanation:

Infrastructure as a Service (IaaS) is a cloud computing model that provides virtualized computing resources over the internet. It offers fundamental infrastructure services such as compute, storage, and networking, which users can provision and manage through a self-service portal. This model allows organizations to scale resources as needed and pay only for what they use.

NEW QUESTION # 57

Question:

A company needs to ensure high availability for its applications and minimize downtime in case of a disk failure. The current storage configuration is a RAID 0 array with SSDs. Which RAID level is most cost effective and would provide the necessary data protection without significant performance degradation?

- A. Maintain the existing RAID 0 configuration with SSDs
- B. Implement a RAID 1 array with SSDs for disk mirroring
- C. Upgrade to a RAID 6 array with SSDs for dual parity protection
- D. **Migrate to a RAID 5 array with SSDs for parity-based protection**

Answer: D

Explanation:

RAID 5 provides a cost-effective balance between:

Data protection(single parity, can tolerate one disk failure).

Performance(especially read-heavy environments).

Cost(uses fewer drives than RAID 1 or 6 for the same capacity).

* RAID 1 (B): Best for read-heavy workloads but doubles the storage needed (mirroring).

* RAID 0 (C): No protection against disk failure.

* RAID 6 (D): More protection (dual parity), but more write penalty and more disks needed.

NEW QUESTION # 58

Question:

An organization needs to adhere to compliance and lower the cost of the primary storage. What process should they implement?

- A. Data backup
- B. Data compression

- C. Data archiving
- D. Data encryption

Answer: C

Explanation:

Data archiving involves moving infrequently accessed data to a separate storage system, freeing up space on primary storage and reducing costs. It also aids in compliance by retaining data for specified periods, as required by various regulations.

- * Data backup:Creates copies of data for recovery purposes but doesn't necessarily reduce primary storage usage.
- * Data archiving:Moves less frequently accessed data to cost-effective storage, aiding compliance and reducing primary storage costs.

* Data encryption:Secures data but doesn't impact storage costs or compliance retention.

* Data compression:Reduces data size but may not meet compliance requirements for data retention.
