

# Nutanix NCP-DB Exam Dumps - 100% Pass Guarantee With Latest Demo [2026]

P.S. Free & New NCP-DB dumps are available on Google Drive shared by DumpsActual: <https://drive.google.com/open?id=1dz4LqBMtkfYsa3OIHKAOeRjka3gnVlkt>

The only aim of our company is to help each customer pass their exam as well as getting the important certification in a short time. If you want to pass your exam and get the NCP-DB certification which is crucial for you successfully, I highly recommend that you should choose the NCP-DB Study Materials from our company so that you can get a good understanding of the exam that you are going to prepare for.

You may think choosing practice at the first time is a little bit like taking gambles. However, you can be assured by our NCP-DB learning quiz with free demos to take reference, and professional elites as your backup. Accuracy rate is unbelievably high and helped over 98 percent of exam candidates pass the exam. By imparting the knowledge of the NCP-DB Exam to those ardent exam candidates who are eager to succeed like you, they treat it as responsibility to offer help. So please prepare to get striking progress if you can get our NCP-DB study guide with following traits for your information

>> NCP-DB Sample Questions Answers <<

## Nutanix NCP-DB Testking Exam Questions - NCP-DB Exam Dumps Collection

To help you get to know the exam questions and knowledge of the NCP-DB practice exam successfully and smoothly, our experts just pick up the necessary and essential content in to our NCP-DB test guide with unequivocal content rather than trivia knowledge that exam do not test at all. To make you understand the content more efficient, our experts add charts, diagrams and examples in to NCP-DB Exam Questions to speed up you pace of gaining success. So these NCP-DB latest dumps will be a turning point in your life. And on your way to success, they can offer titanic help to make your review more relaxing and effective. Moreover, the passing certificate and all benefits coming along are not surreal dreams anymore.

### Nutanix NCP-DB Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none"><li>Describe NDB Concepts: It defines database and NDB terminology. The topic also explains benefits and features of NDB.</li></ul>
Topic 2	<ul style="list-style-type: none"><li>Protect NDB-managed Databases Using Time Machine: SLA retention policies, source databases, clones, protection of databases, and Data Access Management (DAM) policies are discussed in this topic.</li></ul>

Topic 3	<ul style="list-style-type: none"> <li>• Operate and Maintain an NDB Environment: Application of procedural concepts to register database server, provision databases, and test and publish database patches. Additionally, the topic explains the right method to apply Linux OS patches. Lastly, it delves into databases and troubleshooting of NDB operations.</li> </ul>
Topic 4	<ul style="list-style-type: none"> <li>• Monitor Alerts and Storage Usage Within an NDB Implementation: It is all about monitoring alerts and management of storage usage.</li> </ul>
Topic 5	<ul style="list-style-type: none"> <li>• Administer an NDB Environment: While focusing on the administration of an NDB environment, this topic focuses on managing NDB profiles, applying procedural concepts, and managing networks in NDB. Lastly, the topic explains sub-topics of managing access controls in NDB and identifying how to use NDB APIs and CLI.</li> </ul>

## Nutanix Certified Professional - Database Automation (NCP-DB) v6.5 Sample Questions (Q220-Q225):

### NEW QUESTION # 220

When provisioning an PostgreSQL HA Instance, what are the minimum and maximum number of DB server VMs that can be deployed in a cluster?

- A. Min 2, Max 6
- **B. Min 2, Max 4**
- C. Min 3, Max 5
- D. Min 1, Max 3

**Answer: B**

Explanation:

When provisioning a PostgreSQL HA Instance using NDB, the minimum and maximum number of DB server VMs that can be deployed in a cluster are 2 and 4, respectively. A PostgreSQL HA Instance is a database instance that provides high availability and fault tolerance for PostgreSQL databases using the Patroni framework. Patroni is a Python-based tool that manages PostgreSQL configuration and performs automatic failover and switchover operations. Patroni relies on a distributed consensus store, such as etcd, Consul, or ZooKeeper, to store and synchronize the cluster state and leader information. NDB supports etcd as the consensus store for PostgreSQL HA Instances. NDB allows the administrator to provision PostgreSQL HA Instances with different sizes and configurations, such as small, medium, large, or custom. The size of the PostgreSQL HA Instance determines the number of DB server VMs, the number of etcd nodes, the CPU, memory, and disk resources, and the replication factor of the database. The minimum number of DB server VMs for a PostgreSQL HA Instance is 2, which corresponds to a small size instance. This configuration provides one leader and one follower DB server VM, and one etcd node. The maximum number of DB server VMs for a PostgreSQL HA Instance is 4, which corresponds to a large size instance. This configuration provides one leader and three follower DB server VMs, and three etcd nodes. The other options are not valid for a PostgreSQL HA Instance, as they either do not provide enough redundancy or exceed the supported limit of DB server VMs. References:

### NEW QUESTION # 221

When trying to restore a database via Time Machine (TM), the option to restore data to a Point in Time is not available. What should the administrator do to enable Point in Time Recovery?

- A. Use Brass SLA & update the Log catch up frequency.
- B. Update the TM schedule to perform DB Log catch up.
- C. Take a Manual snapshot and use it for DB recovery.

- **D. Use an SLA that supports Continuous Log retention.**

**Answer: D**

Explanation:

Point in Time Recovery (PITR) is a feature of NDB that allows restoring a database to any point in time within the retention period of the SLA. To enable PITR, the SLA must support Continuous Log retention, which means that NDB captures and stores the database logs continuously. This allows NDB to replay the logs from the last snapshot to the desired point in time during the restore process. The other options do not enable PITR, but rather affect the frequency and timing of the snapshots and log catch up operations.

#### NEW QUESTION # 222

Which ports must be open between the NDB server and Controller VMs to facilitate iSCSI connections?

- **A. 3205 and 3260**
- B. 22 and 9440
- C. 80 and 443
- D. 5985 and 5986

**Answer: A**

Explanation:

According to the Nutanix Database Automation (NCP-DB) course, the ports 3205 and 3260 are required for iSCSI connections between the NDB server and the Controller VMs1. Port 3205 is used for the NDB iSCSI initiator service, which initiates the iSCSI sessions and sends SCSI commands to the Controller VMs1. Port

3260 is used for the iSCSI target service, which listens for incoming iSCSI requests and provides access to the storage devices on the Controller VMs1. The other options are not related to iSCSI connections. Port 22 is used for SSH, port 9440 is used for Prism Central, port 80 is used for HTTP, port 443 is used for HTTPS, port

5985 is used for WinRM HTTP, and port 5986 is used for WinRM HTTPS2. References:

#### NEW QUESTION # 223

Within the NDB GUI, an administrator needs to set the shortest schedule interval possible for a database log catch up. Which value, in minutes, will satisfy this requirement?

- A. 0
- B. 1
- C. 2
- **D. 3**

**Answer: D**

Explanation:

The NDB GUI allows an administrator to set the schedule interval for a database log catch up, which is the process of collecting transaction logs periodically from the source databases and storing them in the time machine. The shortest possible value for this interval is 15 minutes, as per the NDB documentation1. This means that the NDB time machine will capture the database logs every 15 minutes and use them for backup, restore, clone, and refresh operations. References: Nutanix Database Management & Automation (NDMA), page 29; Nutanix Support & Insights, section "Log Catch-up"

#### NEW QUESTION # 224

What happens to the primary member in a MongoDB Server Cluster during the NDB patching process?

- A. It is skipped during the patching process to ensure no downtime.
- **B. It is patched first and then becomes a secondary member.**
- C. It is patched last and is restored to its original state.

- D. It becomes a read-only member during the patching process.

**Answer: B**

Explanation:

According to the NDB documentation, the NDB patching process for MongoDB Server Cluster follows these steps1:

- \* NDB identifies the primary member of the MongoDB Server Cluster and patches it first.
- \* NDB triggers a failover to elect a new primary member from the remaining secondary members.
- \* NDB patches the former primary member, which becomes a secondary member after the failover.
- \* NDB patches the remaining secondary members one by one.
- \* NDB verifies the patching status and the cluster health.

This process ensures that the MongoDB Server Cluster always has a primary member available to handle write operations, while minimizing the downtime and the impact on the cluster performance.
