Which capability does GoldenGate support?

- A. Two-phase commit operations from application interfaces
- B. Synchronous transaction Capture from application interfaces
- C. File-based Capture
- **D. Asynchronous Capture and Delivery of committed DML transactions**

NEW QUESTION # 12

How can you tell if GoldenGate has been configured for batch processing?

- **A. The SPECIALRUN parameter is in the Replicat parameter file**
- B. The SPECIALRUN parameter is in the Extract parameter file
- C. There is a dedicated GoldenGate process called SPECIALRUN
- D. The SPECIALRUN parameter is in the GLOBALS parameter file

Answer: A

Explanation:

The SPECIALRUN parameter is used in the Replicat parameter file to configure batch-mode processing such as for initial loads or one-time replication. It disables checkpointing and allows processing of a specific data set without ongoing synchronization.

NEW QUESTION # 13

You have an issue where all threads are waiting for a specific transaction to be executed first. What is this issue related to?

- A. It is caused by THREAD and THREADRANGE being used with wildcard MAP statements.
- B. It is caused by the use of the MAXTRANSOPS parameter.
- C. It is caused by the thread with the highest thread ID applying barrier transactions.
- **D. It is caused by barrier transactions in a Coordinated Replicat.**

In Coordinated Replicat, a barrier transaction is a transaction that must be applied in commit order, causing all threads to pause until that transaction is completed - leading to the situation where all threads wait for one.
