## Snowflake SnowPro® Core Certification (COF-C03) Sample Questions (Q14-

## Q19):

### NEW QUESTION # 14

Which statement describes Snowflake tables?

- A. Snowflake tables require that clustering keys be defined to perform optimally.
- B. Snowflake tables are owned by a user.
- **C. Snowflake tables are logical representation of underlying physical data.**
- D. Snowflake tables are the physical instantiation of data loaded into Snowflake.

**Answer: C**

Explanation:

In Snowflake, tables represent a logical structure through which users interact with the stored data. The actual physical data is stored in micro-partitions managed by Snowflake, and the logical table structure provides the means by which SQL operations are mapped to this data. This architecture allows Snowflake to optimize storage and querying across its distributed, cloud-based data storage system. References: Snowflake Documentation on Tables

### NEW QUESTION # 15

In the Snowflake access control model, which entity owns an object by default?

- A. Ownership depends on the type of object
- **B. The role used to create the object**
- C. The SYSADMIN role
- D. The user who created the object

**Answer: B**

Explanation:

In Snowflake's access control model, the default owner of an object is the role that was used to create the object. This role has the OWNERSHIP privilege on the object and can grant access to other roles.

### NEW QUESTION # 16

Which Query Profile metrics will provide information that can be used to improve query performance? (Select TWO).

- A. Local disk IO
- B. Spillage
- **C. Remote disk IO**
- **D. Pruning**
- E. Synchronization

**Answer: C,D**

Explanation:

Two key metrics in Snowflake's Query Profile that provide insights for performance improvement are:

Remote Disk IO: This measures the time the query spends waiting on remote disk access, indicating potential performance issues related to I/O bottlenecks.

Pruning: This metric reflects how effectively Snowflake's micro-partition pruning is reducing the data scanned. Better pruning (more partitions excluded) leads to faster query performance, as fewer micro-partitions need to be processed.

These metrics are essential for identifying and addressing inefficiencies in data retrieval and storage access, optimizing overall query performance.

### NEW QUESTION # 17

What COPY INTO SQL command should be used to unload data into multiple files?

- **A. SINGLE=FALSE**
- B. SINGLE=TRUE
- C. MULTIPLE=FALSE

- D. MULTIPLE=TRUE

**Answer: A**

Explanation:

The COPY INTO SQL command with the option SINGLE=FALSE is used to unload data into multiple files. This option allows the data to be split into multiple files during the unload process. References: SnowPro Core Certification COPY INTO SQL command unload multiple files

### NEW QUESTION # 18

Which Snowflake function will interpret an input string as a JSON document, and produce a VARIANT value?

- A. flatten
- B. object\_construct()
- C. json\_extract\_path\_text()
- D. parse\_json()

**Answer: D**

Explanation:

The parse\_json() function in Snowflake interprets an input string as a JSON document and produces a VARIANT value containing the JSON document. This function is specifically designed for parsing strings that contain valid JSON information.
