InsuranceSuite-Analyst EXAM DUMPS WITH GUARANTEED SUCCESS

Once downloaded from the website, you can easily study from the Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam exam questions compiled by our highly experienced professionals as directed by the Guidewire InsuranceSuite-Analyst exam syllabus. The Guidewire InsuranceSuite-Analyst Dumps are given regular update checks in case of any update. We make sure that candidates are not preparing for the Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam exam from outdated and unreliable InsuranceSuite-Analyst study material.

Guidewire Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam Sample Questions (Q71-Q76):

NEW QUESTION # 71
Which areas of the UI provide context-sensitive navigation links to the account functionality of PolicyCenter and the various pages of the account file?

- A. Workspace
- B. Tab Bar

- C. Sidebar
- D. Screen Area
- E. Info Bar
- F. QuickJump Box

Answer: B,C

Explanation:
Comprehensive and Detailed Explanation (250-300 words):
In Guidewire PolicyCenter, navigation is designed to provide both high-level access and context-sensitive navigation within a selected business object such as an account.
The Tab Bar (Option D) provides high-level navigation across major functional areas of the application, including Accounts, Policies, Claims, and Administration. It allows users to quickly access the account search and account-related workflows.
Once an account is opened, the Sidebar (Option F) becomes the primary context-sensitive navigation area. It displays links to specific pages within the account file, such as Account Summary, Contacts, Policies, and Activities. The sidebar updates dynamically based on the selected object, making it essential for navigating within the account context.
The remaining options do not provide context-sensitive account navigation. The Info Bar summarizes context, the QuickJump Box supports navigation shortcuts, the Workspace shows supplementary information, and the Screen Area displays page details.

NEW QUESTION # 72
Business case completed, business resources trained, and identified are all deliverables of which phase?

- A. Stabilization
- B. Development
- C. Inception
- D. Pre-Inception

Answer: D

Explanation:
Comprehensive and Detailed Explanation (250-300 words):
The Pre-Inception phase is the earliest phase in a Guidewire implementation and focuses on organizational readiness and project justification. Therefore, Option D is correct.
During Pre-Inception, the business case is completed to justify the investment and define expected benefits.
Key business resources are identified and trained, ensuring that the organization is prepared to participate effectively in the project. This phase establishes sponsorship, funding approval, and initial governance.
Inception, Development, and Stabilization occur after this foundational groundwork is complete, making them incorrect for this question.

NEW QUESTION # 73
A Quality Analyst is reviewing the test data setup for a Guidewire PolicyCenter project. To ensure comprehensive testing, the analyst needs to understand how different data elements are linked within the system. Which two data modeling concepts are critical for understanding data relationships and dependencies in InsuranceSuite?

- A. The entities that represent key business objects (for example, Policy, Coverage) and their attributes
- B. The creation and management of business rules for automated decision-making
- C. The data encryption algorithms used to protect sensitive information
- D. The database backup and recovery procedures
- E. The foreign key relationships that establish links between different entities
- F. The performance indexes defined on database tables

Answer: A,E

Explanation:
In Guidewire InsuranceSuite, understanding how data is structured and related is essential for setting up accurate and effective test data. For a Quality Analyst, the most critical data modeling concepts are entities with their attributes and foreign key relationships, making Options A and C correct.
Entities represent core business objects such as Policy, PolicyPeriod, Coverage, Account, or Contact. Each entity contains attributes that store specific business data. Understanding which entities exist and what attributes they contain allows a QA analyst to identify

which data elements must be populated to support specific test scenarios, such as quoting, binding, or endorsement processing. Foreign key relationships define how entities are linked to one another. For example, a Policy is linked to an Account, and a Coverage is linked to a PolicyPeriod. These relationships establish dependencies that must be respected when creating test data. If related records are missing or incorrectly linked, test cases may fail for reasons unrelated to the functionality being tested.

The remaining options are not directly relevant to understanding data relationships. Backup and recovery procedures (Option B), encryption algorithms (Option D), and performance indexes (Option E) are infrastructure or technical concerns. Business rules (Option F) influence behavior but do not define data relationships.

By understanding entities and their relationships, Quality Analysts can create realistic, complete test data that accurately reflects how InsuranceSuite processes information across workflows.

NEW QUESTION # 74
The goal of an elaboration workshop is to identify value-driven changes to the OOTB User Story that supports business processes. Who are the key stakeholders in this process?

- A. Business Analyst
- B. Scrum Master
- C. Development resources
- D. Subject Matter Expert

Answer: A,D

Explanation:
Comprehensive and Detailed Explanation:
Elaboration Workshops (typically occurring during the Inception phase) are the primary venue for defining and refining requirements. The goal is to take the "Out-of-the-Box" (OOTB) user stories and determine if they meet business needs or if changes are required to deliver specific business value.
The Key Stakeholders required to drive this specific process are:
* Subject Matter Experts (SMEs) (D):They are the "Voice of the Customer." They possess the deep business knowledge required to explain the current and desired processes. They are the ones who determine if a feature has value and define the acceptance criteria. Without them, the "value-driven" aspect of the workshop cannot be achieved.
* Business Analysts (BAs) (A):They facilitate the workshop. Their role is to elicit the information from the SMEs, challenge assumptions to ensure simplicity (sticking to OOTB where possible), and document the requirements into clear User Stories. They act as the bridge between the business need and the technical solution.
Why the others are not "Key Stakeholders" for identifying value:
* Development resources (C):While developers (or Architects) often attend these workshops (part of the
"Three Amigos" concept) to provide technical feasibility assessments and cost estimates, they do not define the business value. They define the solution.
* Scrum Master (B):The Scrum Master ensures the Agile process is followed and removes impediments but does not contribute to the content of the requirements or the definition of business value.

NEW QUESTION # 75
A Guidewire Cloud project needs to implement functionality that tracks certification status held by contractors performing work on a claim. The status will be selected from a predefined list, and the user will also need to capture free-text notes about the certification. Applying your understanding of the Guidewire Data Model, which two changes to the base data model structure are MOST likely needed to support these requirements?

- A. Create a Typelist to define the specific certification types
- B. Add new fields (for example, text or typekey)
- C. Update the relevant PCF file for the screen
- D. Add a new entity specifically for Contractor Certifications
- E. Add two new labels (for example, text or typekey)
- F. Create a .TTX file for the specific certification types

Answer: A,B

Explanation:
When extending the Guidewire data model, analysts must distinguish between data structure changes and UI or presentation changes. In this scenario, the business requirement is to store a certification status selected from a predefined list and free-text notes related to that certification.

The correct data model changes are to create a Typelist and add new fields, making Options D and E correct.

A Typelist (Option D) is the standard Guidewire mechanism for representing a predefined set of selectable values, such as certification statuses (for example, Certified, Expired, Pending). Typelists ensure data consistency, support localization, and integrate cleanly with rules, validations, and UI components.

In addition, new fields must be added to the data model (Option E). One field would typically be a typekey referencing the typelist for certification status, and another would be a text field to store the free-text certification notes. These fields would be added to an appropriate existing entity (such as a contractor-related or claim-related entity), depending on the design.

The other options are not data model changes. Updating PCF files (Option A) affects the UI, not how data is stored. Creating a new entity (Option B) is unnecessary unless there is a complex, repeatable certification structure. A .ttx file (Option C) is not used for typelist definition. Labels (Option F) control display text, not data storage.

NEW QUESTION # 76

......

With both InsuranceSuite-Analyst exam practice test software you can understand the Associate Certification - InsuranceSuite Analyst - Mammoth Proctored Exam (InsuranceSuite-Analyst) exam format and polish your exam time management skills. Having experience with InsuranceSuite-Analyst exam dumps environment and structure of exam questions greatly help you to perform well in the final InsuranceSuite-Analyst Exam. The desktop practice test software is supported by Windows. Our web-based practice exam is compatible with all browsers and operating systems.
