## Prominent Features of PremiumVCEDump Confluent CCDAK Exam Practice Test Questions

After you purchase our CCDAK learning materials, we will still provide you with excellent service. Our customer service is 24 hours online, you can contact us any time you encounter any problems. Of course, you can also send us an email to contact with us on the CCDAK Study Guide. We will reply you the first time. As you know, there are many users of CCDAK exam preparation. But we work high-efficiently 24/7 to give you guidance.

## Confluent Certified Developer for Apache Kafka Certification Examination Sample Questions (Q65-Q70):

### NEW QUESTION # 65

What is true about partitions? (select two)

- A. Only out of sync replicas are replicas, the remaining partitions that are in sync are also leader
- B. You cannot have more partitions than the number of brokers in your cluster
- C. A partition has one replica that is a leader, while the other replicas are followers

- D. A broker can have different partitions numbers for the same topic on its disk
- E. A broker can have a partition and its replica on its disk

**Answer: C,D**

Explanation:

Only one of the replicas is elected as partition leader. And a broker can definitely hold many partitions from the same topic on its disk, try creating a topic with 12 partitions on one broker!

#### NEW QUESTION # 66

A client connects to a broker in the cluster and sends a fetch request for a partition in a topic. It gets an exception Not Leader For Partition Exception in the response. How does client handle this situation?

- A. Send fetch request to each Broker in the cluster
- B. Send metadata request to the same broker for the topic and select the broker hosting the leader replica
- C. Send metadata request to Zookeeper for the topic and select the broker hosting the leader replica
- D. Get the Broker id from Zookeeper that is hosting the leader replica and send request to it

**Answer: B**

Explanation:

In case the consumer has the wrong leader of a partition, it will issue a metadata request. The Metadata request can be handled by any node, so clients know afterwards which broker are the designated leader for the topic partitions. Produce and consume requests can only be sent to the node hosting partition leader.

#### NEW QUESTION # 67

You need to configure a sink connector to write records that fail into a dead letter queue topic.

Requirements:

\* Topic name: DLQ-Topic

\* Headers containing error context must be added to the messages Which three configuration parameters are necessary?(Select three.)

- A. errors.log.enable=true
- B. errors.deadletterqueue.context.headers.enable=true
- C. errors.log.include.messages=true
- D. errors.deadletterqueue.topic.name=DLQ-Topic
- E. errors.tolerance=all
- F. errors.tolerance=none

**Answer: B,D,E**

Explanation:

To send failed records to a dead letter queue (DLQ), you must configure:

\* errors.tolerance=all: Tells the connector to not fail on errors but handle them (e.g., send to DLQ).

\* errors.deadletterqueue.topic.name=DLQ-Topic: Specifies the DLQ topic.

\* errors.deadletterqueue.context.headers.enable=true: Includes error context in message headers.

From Kafka Connect Error Handling Docs:

"Kafka Connect supports directing problematic records to a separate topic (DLQ) using errors.\* configs.

Headers can include failure metadata."

Options D, E, F are related to logging, not DLQ behavior.

Reference: Kafka Connect Configurations > Error Handling

#### NEW QUESTION # 68

How do you create a topic named test with 3 partitions and 3 replicas using the Kafka CLI?

- A. bin/kafka-topics.sh --create --bootstrap-server localhost:9092 --replication-factor 3 --partitions 3 --topic test
- B. bin/kafka-topics.sh --create --bootstrap-server localhost:2181 --replication-factor 3 --partitions 3 --topic test
- C. bin/kafka-topics-create.sh --zookeeper localhost:9092 --replication-factor 3 --partitions 3 --topic test

- D. bin/kafka-topics.sh --create --broker-list localhost:9092 --replication-factor 3 --partitions 3 --topic test

**Answer: A**

Explanation:

As of Kafka 2.3, the kafka-topics.sh command can take --bootstrap-server localhost:9092 as an argument. You could also use the (now deprecated) option of --zookeeper localhost:2181.

#### NEW QUESTION # 69

Your Kafka cluster has five brokers. The topic t1 on the cluster has:

- \* Two partitions
  - \* Replication factor = 4
  - \* min.insync.replicas = 3
- You need strong durability guarantees for messages written to topic t1. You configure a producer acks=all and all the replicas for t1 are in-sync. How many brokers need to acknowledge a message before it is considered committed?

- A. 0
- B. 1
- C. 2
- **D. 3**

**Answer: D**

Explanation:

With acks=all, the leader waits for min.insync.replicas to acknowledge the message. Since min.insync.replicas=3, Kafka will only commit the message once 3 brokers (leader + 2 followers) confirm they have the message.

From Kafka Documentation > Acks and Durability:

"If acks=all is specified, the producer will wait until the full set of in-sync replicas has acknowledged the record. The minimum number of in-sync replicas is controlled by min.insync.replicas." Even though the replication factor is 4, only 3 acknowledgments are needed, as defined by min.insync.replicas.

Reference: Apache Kafka Producer Configs > acks, min.insync.replicas

#### NEW QUESTION # 70

.....

PremiumVCEDump have a huge senior IT expert team. They use their professional IT knowledge and rich experience to develop a wide range of different training plans which can help you pass Confluent certification CCDAK exam successfully. In PremiumVCEDump you can always find out the most suitable training way for you to pass the exam easily. No matter you choose which kind of the training method, PremiumVCEDump will provide you a free one-year update service. PremiumVCEDump's information resources are very wide and also very accurate. When selecting PremiumVCEDump, passing Confluent Certification CCDAK Exam is much more simple for you.
