If you're a Salesforce professional looking to take your career to the next level, earning this certification is an excellent way to do so.

Salesforce Certified Sharing and Visibility Architect Sample Questions (Q56-Q61):

NEW QUESTION # 56

Universal Containers (UC) uses a custom lightning component with an Apex class to display shipment information (custom object, private OWD). UC sales managers are complaining about two important points:

- * Shipment records that belong to their teams can be seen by other users.
- * Shipment amount should be visible only by managers, but sales reps are able to view it. Which two features did the development team miss that is causing the problems?

Choose 2 answers.

- A. Use With Sharing keyword in Apex classes to enforce sharing rules evaluation.
- B. Use isSharable keyword in Apex classes to assure record visibility.
- C. Use isAccessible() method in Apex classes to check field accessibility
- D. Use runAs in test class to enforce user permissions and field-level permissions.

Answer: A,C

NEW QUESTION # 57

A user posts a file to the Chatter feed for a record of an object that has a Private organization-wide default. Which statement accurately describes who can view the file by default?

- A. Only the user who posted the file
- B. the user who posted the file and users with a shared Chatter post link to the file
- C. The user who posted the file and users with access to the record

Answer: C

Explanation:

* File Visibility on Chatter:

* When a file is posted to a Chatter feed, its visibility is tied to the sharing settings of the associated record.

* For objects with a Private OWD, only users with access to the record can view the file.

* Why Option C is Correct:

* The file is visible to the user who posted it and any users who have access to the related record due to sharing rules or Role Hierarchy.

* Why Others Are Incorrect:

* Option A: Users with a shared link to the file cannot view it unless they also have access to the record.

* Option B: Other users with record access can view the file, so it is not limited to the user who posted it.

For more information, see Salesforce documentation on Chatter File Visibility: <https://help.salesforce.com/>

NEW QUESTION # 58

Besides their own team accounts, sales managers at Universal Containers need to have READ access to all accounts of the same segment in other countries. Role hierarchy was implemented accordingly (based on countries), but a sales manager in the US is complaining that he cannot view account records of the same segment in Canada. What should be done to grant access in a proper way?

- A. Create a public group and include all accounts of the same segment and grant access through a permission set.
- B. Create criteria-based sharing rules to grant access to account records that have the same segment to all sales manager roles.
- C. Create an owner-based sharing rule to grant access to account records that have the same segment to all sales manager roles.
- D. Change the role hierarchy and put all of the sales managers in the US and Canada in the same role.

Answer: B

Explanation:

Explanation

Criteria-based sharing rules are used to share records based on field values, not ownership. This is the best option to grant access to

accounts of the same segment in other countries, regardless of who owns them.

Owner-based sharing rules are based on the owner of the record, not the segment. Changing the role hierarchy would affect other aspects of data visibility and security. Creating a public group and a permission set would require manual maintenance and would not be scalable.

NEW QUESTION # 59

A developer at Universal Container is building an integration within a managed package for their internal org that requires login to an external system. The end point requires basic authentication. The Architect would like to ensure that the username and password are managed securely. Which three options should the Architect recommend to secure the credentials?

- A. Store the credentials in the apex code, which will not be available to non-admins
- **B. Store the credentials in protected custom settings that are used in the apex callout**
- **C. Store the credentials in named credentials that are used in the apex callout**
- **D. Store the credentials in protected custom metadata that are used in the apex callout**
- E. Store the credentials in a custom object using encrypted fields

Answer: B,C,D

Explanation:

Explanation

Named Credentials, Protected Custom Metadata, and Protected Custom Settings are three options to secure the credentials for the external system. They allow the developer to store the credentials in a secure way that is not exposed to other users or packages. Storing the credentials in a custom object using encrypted fields or in the apex code are not secure options

NEW QUESTION # 60

Universal Containers (UC) has a mostly Private organization-wide default, as it's a core principle of UC to respect client data privacy, UC has implemented complex processes for granting access to Opportunity data. A few key members of the sales reporting team need to always be able to see, but not change, Opportunity data for all opportunities.

What should an architect recommend as an approach to meet these requirements?

- **A. Create a permission set that grants the View All permission for Opportunity.**
- B. Create # permission set that grants the View All Data permission.
- C. Give the View All Data permission to the Sales Reporting profile.

Answer: A
