

Free PDF Quiz Juniper - JN0-481 - Data Center, Specialist (JNCIS-DC) Updated Test Dumps.zip

Juniper JN0-481 Exam

Data Center, Specialist (JNCIS-DC)

<https://www.passquestion.com/jn0-481.html>

P.S. Free & New JN0-481 dumps are available on Google Drive shared by ValidDumps: <https://drive.google.com/open?id=1PEc3qTxNGjyhF70Vo17p3pBHbrg9buul>

If you are going to purchase JN0-481 test materials online, the safety of the website is significant. We provide you with a clean and safe online shopping environment if you buying JN0-481 training materials from us. We have professional technicians to exam the website every day, therefore the safety for the website can be guaranteed. Moreover, JN0-481 Exam Materials are high quality and accuracy, and you can pass the exam just one time. We offer you free update for 356 days for JN0-481 training materials and the update version will be sent to your email automatically.

Juniper JN0-481 Exam Syllabus Topics:

Topic	Details
Topic 1	<ul style="list-style-type: none">Data Center Multitenancy: Covers multi-tenant network management through routing zones, VRFs, virtual networks, connectivity templates, security policies, VMware integration, and Data Center Interconnect.
Topic 2	<ul style="list-style-type: none">Blueprint Operations: Covers day-to-day blueprint management including making and reverting changes, querying, virtual networks, Time Voyager, anomaly detection, property sets, configlets, and configuration types.
Topic 3	<ul style="list-style-type: none">Apstra Build and Deploy Phases: Covers fabric deployment tasks including agent installation, cable mapping, device states, deploy modes, and Blueprint UI usage, along with related monitoring and troubleshooting.
Topic 4	<ul style="list-style-type: none">Intent-Based Analytics: Covers Apstra's analytics tools including Graph Explorer, graph queries, and intent-based analytics probes for network monitoring, validation, and troubleshooting.
Topic 5	<ul style="list-style-type: none">Juniper Apstra Architecture: Introduces core Apstra components including the server, device agents, and UI, along with administrative features such as RBAC, event logging, and syslog.

New Juniper JN0-481 Exam Papers, Exam JN0-481 Material

Getting tired of humdrum life, you may want to get some successful feeling or try something different instead. We all know that is of important to pass the JN0-481 exam and get the JN0-481 certification for someone who wants to find a good job in internet area, and it is not a simple thing to prepare for exam. So you are in the right place now. The JN0-481 practice materials are a great beginning to prepare your exam. Actually, just think of our Juniper practice materials as the best way to pass the exam is myopic.

They can not only achieve this, but ingeniously help you remember more content at the same time.

Juniper Data Center, Specialist (JNCIS-DC) Sample Questions (Q28-Q33):

NEW QUESTION # 28

You have a virtual network that needs controlled access to other virtual networks in the same routing zone. Using the Juniper Apstra UI, which feature would be used to accomplish this task?

- A. routing policy
- B. anti-affinity policy
- C. interface policy
- D. security policy

Answer: D

Explanation:

A security policy is the feature that would be used to accomplish the task of controlling access to other virtual networks in the same routing zone using the Juniper Apstra UI. A security policy allows you to define rules that specify which traffic is allowed or denied between different virtual networks, IP endpoints, or routing zones. A security policy can be applied to one or more virtual networks in the same routing zone, and it can use various criteria to match the traffic, such as source and destination IP addresses, protocols, ports, or tags. A security policy can also support DHCP relay, which enables the forwarding of DHCP requests from one virtual network to another.

NEW QUESTION # 29

Which type of generic system should you select when adding a new server inside an existing rack type?

- A. rack generic
- B. embedded generic
- C. internal generic
- D. external generic

Answer: A

Explanation:

When adding a new server inside an existing rack type in Juniper Apstra, you should select a rack generic system. This type is used for devices (like servers or appliances) that are physically located within the rack and are part of the fabric's structured design, allowing consistent interface mapping and connectivity.

NEW QUESTION # 30

You are allowed to assign tags for which three objects? (Choose three.)

- A. Property sets
- B. Interfaces
- C. Generic systems
- D. Device profiles
- E. Virtual networks

Answer: B,C,E

Explanation:

In Apstra, tags are an intent-level metadata mechanism used to classify objects and drive automation and reuse. Within a data center blueprint, Apstra supports tagging multiple blueprint objects so operators can apply configuration or policy logic conditionally (for example, applying a connectivity template or a configlet based on a tag match). In this scenario, three valid taggable objects are virtual networks, interfaces, and generic systems.

Virtual network tagging is supported directly from the blueprint's virtual network table, enabling you to label virtual networks (such as "finance," "pci," or "dev") and then reference those tags elsewhere in blueprint operations and policy application. Interface tagging is also explicitly supported in the blueprint, allowing you to assign tags to switch interfaces and use those tags to control how templates, assignments, or other intent-driven operations apply to those ports. Finally, generic systems (which are modeled endpoint systems such as servers or external routers represented as "systems" in the blueprint) can be tagged so that downstream intent logic

can distinguish system roles and apply the correct operations consistently across expansions and changes.

By contrast, property sets are structured data objects used for variable substitution and probe/configlet parameterization, not a primary target for operational tagging in the blueprint UI; and device profiles are catalog artifacts describing hardware/NOS compatibility rather than blueprint objects typically tagged for intent application.

NEW QUESTION # 31

You are creating a template using Juniper Apstra.

In this scenario, what is a rack-based design compared to a pod-based design?

- A. A rack-based design allows the operator to select a specified number of downlinked servers, whereas a pod-based design only allows the operator to select fixed "pods" of servers.
- B. A rack-based design connects local servers only, whereas a pod-based design can include virtual workloads in a public cloud.
- C. A rack-based design refers to a three-stage Clos, and a pod design refers to a five-stage Clos.
- D. A rack-based design is suitable for physical servers, whereas a pod-based design is used for Kubernetes deployments.

Answer: C

Explanation:

In Juniper Apstra:

A rack-based design typically maps to a three-stage Clos topology, where racks are the unit of scale and directly connect to spine devices.

A pod-based design corresponds to a five-stage Clos topology, where multiple racks are grouped into pods, and the fabric scales further using additional layers (e.g., super spines).

NEW QUESTION # 32

What is the primary reason for creating an Apstra worker node?

- A. To run Zero Touch Provisioning (ZTP)
- B. To support more than one blueprint
- C. To create a space for storing event logs
- D. To offload off-box agents and Intent-Based Analytics (IBA)

Answer: D

Explanation:

In Apstra 5.1, the worker node's primary purpose is to add scalable runtime capacity to an Apstra cluster by hosting off-box services that would otherwise consume resources on the controller. Specifically, worker nodes run containerized services such as off-box device agents (used to communicate with and manage devices) and Intent-Based Analytics (IBA) components (such as probes and analytics-related services). This design keeps the controller node focused on cluster management and control-plane functions (API handling, cluster-wide state, blueprint control workflows), while shifting resource-intensive operational services to worker nodes.

As your fabric grows—more switches, more telemetry, more devices requiring agent connectivity—CPU and memory demand increases notably, especially when IBA is enabled. Adding worker nodes allows you to scale those container workloads horizontally without redesigning the fabric or reducing analytics coverage. In a Juniper data center built on EVPN-VXLAN with Junos v24.4 leaf-spine roles, this separation helps ensure that Apstra can continuously validate intent, process streaming telemetry, and maintain device communications reliably at scale. Worker nodes therefore exist primarily to offload and scale operational agents and IBA services, improving performance and resilience for larger deployments.

NEW QUESTION # 33

.....

Working in IT field, you definitely want to prove your ability by passing IT certification test. Moreover, the colleagues and the friends with IT certificate have been growing. In this case, if you have none, you will not be able to catch up with the others. For example like Juniper JN0-481 Certification Exam, it is a very valuable examination, which must help you realize your wishes.
