Explanation:

By default, the router that originally sourced the route into BGP places its peer address into the attribute field. The next-hop value is then typically changed when the route is transmitted across external gGP (EBGP) links. Internal BGP (IBGP) peers do not alter the next-hop value between themselves.

B: By default, the next-hop value is changed when a route is passed from an EBGp peer to another EBGp peer.

C: By default, the next-hop value is retained when a route is advertised across IBGP links.
