If you face any problem while using the offline or online software Junos, Associate (JNCIA-Junos) (JN0-105) practice exam of RealExamFree, contact our customer service team. Our team of experts is available 24/7 for your assistance while using updated JN0-105 Exam Prep material. Many takers of the Junos, Associate (JNCIA-Junos) (JN0-105) practice test suffer from money loss because it introduces new changes in the content of the test.

Juniper Junos, Associate (JNCIA-Junos) Sample Questions (Q95-Q100):

NEW QUESTION # 95

Which two statements are correct about firewall filters? (Choose two.)

- A. There can be only one firewall filter.
- B. "Accept" is the default action of packets that are not explicitly allowed.
- C. "Discard" is the default action of packets that are not explicitly allowed.
- D. There can be multiple firewall filters.

Answer: C,D

Explanation:

In Juniper Networks devices, firewall filters are used to control packet flow through the device. The default action for packets that do not match any of the specified criteria in the firewall filter is to discard them, enhancing network security by ensuring that only explicitly allowed traffic can pass through. Furthermore, it is possible to configure multiple firewall filters on a device, allowing for granular control over traffic based on various criteria such as source, destination, and protocol type.

NEW QUESTION # 96

Exhibit

Exhibit

[edit]

```
root# set system host-name TEST_DEVICE [edit]
```

```
root# commit
```

[edit]

'system'

Missing mandatory statement: 'root-authentication' error: commit failed: (missing mandatory statements) [edit] root# You are configuring a new device.

Which action solves the error shown in the exhibit?

- A. reinstalling Junos
- B. loading the factory-default configuration
- C. configuring a non-root username and password
- D. configuring a password for the root account

Answer: D

Explanation:

The error message in the exhibit indicates that the root-authentication statement is missing, which is mandatory for committing the configuration. In Junos OS, it is required to set a password for the root account to commit any configuration changes. This is a security measure to ensure that unauthorized users cannot access the device's configuration mode. To solve the error shown in the exhibit, configuring a password for the root account is necessary. This can be done by using the set system root-authentication plain-text-password command, after which the user will be prompted to enter a new password for the root account.

NEW QUESTION # 97

What are two methods for navigating to configuration mode from an operational mode prompt? (Choose two.)

- A. Use the configure command.
- B. Use the quit command.
- C. Use the edit command.
- D. Use the exit command.

Answer: A,C

Explanation:

In Junos OS, to navigate from operational mode to configuration mode, you can use either the editor or configure command. Both commands move the CLI from operational mode, where you can view the state of the device, to configuration mode, where you can make changes to the device's configuration.

NEW QUESTION # 98

Which two external authentication methods does Junos support for administrative access? (Choose two.)

- A. ACE
- B. NIS
- C. RADIUS
- **D. TACACS+**

Answer: D

Explanation:

Junos OS supports several external authentication methods for administrative access, with TACACS+ (Terminal Access Controller Access-Control System Plus) and RADIUS (Remote Authentication Dial-In User Service) being among the most commonly used. Both TACACS+ and RADIUS are protocols that allow network devices to communicate with a central authentication server, enabling centralized control over user authentication and authorization. This centralization simplifies the management of user credentials and access policies, especially in larger networks with multiple devices.

NEW QUESTION # 99

You want to configure the management port on a Juniper device. In this scenario, what is the management interface name?

- A. mt0
- **B. fxp0**
- C. st0
- D. mtun0

Answer: B

Explanation:

In Junos OS, the dedicated out-of-band management interface is typically named fxp0. This interface is used exclusively for management traffic and is physically separated from the data traffic interfaces. It allows administrators to perform management tasks even when the device is experiencing issues that affect the forwarding plane.

From the JNCIA-Junos Study Guide and Junos OS Documentation:

"The fxp0 interface is a dedicated management interface that provides out-of-band management access. It is commonly found on Juniper routers, switches, and security platforms. You assign IP addresses to this interface as you would any other, and it is often used to connect to a management network or to allow SSH, Telnet, or SNMP access."
