NEW QUESTION # 26

Which activity is facilitated by natural language processing?

- A. Calculating numerical data statistics
- B. Managing parallel computing
- C. Verifying experiment measurements
- **D. Checking for grammar errors**

Answer: D

Explanation:

Checking for grammar errors is a quintessential NLP task. Modern grammar checkers (like Grammarly or the built-in tools in Word and ChatGPT) do not just look for misspelled words; they utilize NLP to understand the syntactic structure of a sentence. This allows the AI to identify complex issues such as subject-verb disagreement, dangling modifiers, and improper tense usage. NLP models are trained on the rules of linguistics and large corpora of well-written text, allowing them to predict what a "correct" sentence should look like. This facilitates more than just mechanical correction; it allows the AI to suggest improvements in tone, clarity, and conciseness. Because the AI "understands" the relationship between different parts of speech, it can offer context-aware suggestions. For example, it can distinguish between "there," "their," and "they're" based on the surrounding words—a task that a simple spell-checker cannot do. This application is foundational to prompt engineering because users often use AI as an editor. By facilitating high-quality grammar and style checking, NLP allows for more professional communication and ensures that the final output of any prompt is polished and ready for a human audience.

NEW QUESTION # 27

A person wants to use an AI model to predict the winner of an athletic event. The person repeatedly prompts the model until it chooses the person's favorite athlete as the winner. What is the type of bias described in the scenario?

- A. Measurement bias
- B. Algorithmic bias
- **C. Confirmation bias**
- D. Sampling bias

Answer: C

Explanation:

This scenario is a textbook example of Confirmation bias. Unlike other biases that reside within the data or the algorithm, confirmation bias is a cognitive bias on the part of the user. It occurs when a person searches for, interprets, or prioritizes information in a way that confirms their pre-existing beliefs or desires. By repeatedly prompting the AI until it provides the "desired" answer, the user is disregarding all previous outputs that contradicted their preference.

In the context of prompt engineering, confirmation bias can lead to "leading prompts" where the user subconsciously (or consciously) steers the AI toward a specific conclusion (e.g., "Tell me why Athlete X is the best"). This undermines the AI's value as an objective tool for analysis. To mitigate this, prompt engineers should practice "neutral prompting" and seek to explore multiple perspectives (using techniques like Tree of Thought) rather than hunting for a specific output. Failing to recognize confirmation bias can lead to poor decision-making and the creation of "echo chambers" where AI is used to justify subjective opinions rather than uncover objective truths.

NEW QUESTION # 28

Which prompting technique encourages exploration before choosing a most suitable response?

- A. Few-Shot
- **B. Tree of thought (TOT)**
- C. Generated knowledge
- D. Cognitive verifier pattern

Answer: B

Explanation:

The Tree of Thought (TOT) technique is an advanced prompt engineering framework specifically designed for complex problem-solving. Unlike standard linear prompting, TOT encourages the model to generate multiple "branches" of reasoning or potential solutions simultaneously. It then evaluates these different paths—acting much like a human "brainstorming" session—before deciding which "branch" is most likely to lead to a successful outcome.

This technique is invaluable for tasks requiring strategic planning or creative exploration where there isn't a single "correct" answer. By prompting the AI to "think through three different approaches and then select the best one," the user leverages the model's ability to self-critique. While "Few-Shot" provides examples and

"Generated Knowledge" provides facts, TOT provides a logical structure for deliberation. This mimics higher-level cognitive processes and significantly improves the model's performance on difficult reasoning tasks by allowing it to "backtrack" if a certain line of reasoning proves to be a dead end, ultimately leading to a more robust and verified final response.

NEW QUESTION # 29

What is a risk associated with failing to include a goal when writing a prompt?

- A. Conflicting personas
- **B. Inaccurate responses**
- C. Nonsensical information
- D. Blatant misinformation

Answer: B

Explanation:

Failing to include a clear goal creates a significant risk of receiving inaccurate responses. In the context of AI, "inaccuracy" doesn't just mean a factual error; it also refers to an output that is "off-target" for the user's intent. Without a goal (the specific outcome the user wants to achieve), the AI is forced to make assumptions about what the user wants. These assumptions are often based on the most common patterns in its training data, which may not align with the user's actual needs.

For example, if a user provides context about a product but doesn't state the goal (e.g., "Write a product description," "Critique this product," or "Compare this product to X"), the AI might simply summarize the text provided. This response is "inaccurate" because it fails to fulfill the user's unspoken requirement. This lack of direction leads to a "hallucination of intent," where the AI provides a response that is technically coherent but practically useless. Clearly defining the goal is the most effective way to anchor the AI's logic, ensuring that the generated content is accurate in terms of both facts and function.

NEW QUESTION # 30

Which strategy is effective for a company to promote the ethical use of AI?

- **A. Foster collaboration among diverse stakeholders to address ethical challenges**
- B. Use an AI system to evaluate job applicants based on fair and ethical criteria
- C. Encourage users to ethically evaluate AI responses using their personal data
- D. Require employees to use an AI model to make a decision for any ethical dilemma

Answer: A

Explanation:

The most effective strategy for promoting ethical AI is to foster collaboration among diverse stakeholders.

Ethics in AI is not a purely technical problem that can be "solved" with code; it is a socio-technical challenge that requires input from various perspectives, including ethicists, legal experts, social scientists, engineers, and, most importantly, the communities affected by the AI.

Diverse collaboration helps identify "blind spots" that a homogenous technical team might miss. For example, a developer might not realize that a specific data feature is a proxy for race or gender, but a sociologist or a community advocate might recognize it immediately. By bringing these voices together, a company can develop "Ethics by Design" frameworks that proactively address bias, transparency, and safety issues before the AI is deployed. This approach aligns with the principle of "Multidisciplinary Oversight," ensuring that the AI's goals are aligned with human values. Relying purely on the AI to solve its own ethical dilemmas (Option A) is dangerous, as the AI lacks a true moral compass. Instead, human-led collaboration ensures that technology remains a servant to societal well-being.
