Available Choices (select all choices that are correct)

- A. Aligned needs of industrial users
- B. Aligned development process
- C. Well-documented security policies and procedures

問題 #210

How many element groups are in the "Addressing Risk" CSMS category?

Available Choices (select all choices that are correct)

- A. 0
- **B. 1**
- C. 2
- D. 3

答案： B

解題說明：

The "Addressing Risk" CSMS category consists of three element groups: Security Policy, Organization and Awareness; Selected Security Countermeasures; and Implementation of Security Program¹. These element groups cover the aspects of defining the security objectives, roles and responsibilities, policies and procedures, awareness and training, security countermeasures selection and implementation, and security program execution and maintenance¹. The "Addressing Risk" CSMS category aims to reduce the security risk to an acceptable level by applying appropriate security measures to the system under consideration (SuC)¹. 問題 #212

In a defense-in-depth strategy, what is the purpose of role-based access control?
Available Choices (select all choices that are correct)

- A. Ensures that users can access only certain devices on the network
- **B. Ensures that users can access only the functions they need for their job**
- C. Ensures that users can access systems from remote locations
- D. Ensures that users correctly manage their username and password

答案： B

解題說明：

Role-based access control (RBAC) is a method of restricting access to resources based on the roles of individual users within an organization. RBAC assigns permissions and responsibilities to roles, rather than to individual users, and then assigns users to those roles. This way, users can only perform the actions that are relevant and necessary for their role, and not access or modify any other resources that are beyond their scope of authority. RBAC is one of the security countermeasures that can be implemented in a defense-in-depth strategy, which is a layered approach to protect industrial automation and control systems (IACS) from cyber threats. RBAC can help prevent unauthorized access, misuse, or sabotage of IACS resources, as well as reduce the risk of human error or insider attacks.
